
Plain: Each bar shows how much the debris drift and sound data support the Pléiades area. 'Joint carry' gives unscored impact points the average Pléiades value of scored points; 'drift-only carry' keeps their own value. The two particle halves show the random noise of the drift model. Results are not converged.

Technical: composer pass 1, core run C (4 strata x 8 seeds, NOT CONVERGED), +unpowered, strata re-weighted by 00:19 evidence, all rows (no 212 m/s filter). Drift GLORYS12+ERA5 production surface, 367 nodes at 30 NM, unscored weight 0.19-0.34 by surface. GlobCurrent row: as-run surface with audit F1 windage bias. Hydro stand-in, not calibrated. Exact re-weighting of composer G row weights; ln R = ln E_G[L_P] - ln E_P1[L_P]; Pléiades lnL_pleiades_glorys12, conditional on objects being MH370 debris.
