
(i) Plain: Values below 0 mean the satellite-based flight model makes the H01W sound less likely as the impact than as one of the other sounds in the same 21 minutes. Bars show the range over the 24 main-route seeds; long bars mean the value is not stable. Searches, drift and other evidence are not used.

(ii) Technical: ln B = ln(sum_i w_i L_i / lambda), lambda = 18/(1,260 s x 140 deg) (Kadri Table 1 rate over 00:36-00:57 and 200-340 deg); w_i = end-of-flight run J cells "D{d} total q=0.333 (C2 silent)" mixed over four strata; arm V2 = run-j-joined-v2 seeds 1-21 (D0-D4). Sensitivity: one chance arrival without the 18-transient rate adds ln 18 = +2.89 to every value. Bars: per-seed min-max over run-j-waypoints seeds. Conditional effective samples 1-280: every value UNCONVERGED (estimability rule: >= 30 effective parents per seed not met). Physics PROVISIONAL; no search, drift or hydro-propagation terms.
