

Plain (ASD-STE100): The curves show where the aircraft was at 00:19:37 UTC, by latitude, for the free-flight family of run J and before the drift and search evidence. Most probability is near 37° S and 36° S. A second peak is near 25–28° S, with a low near 31–32° S (grey band 31.5–25° S). Paths that end there make one large left turn near 29° S between about 23:10 and 23:50, after the 23:14 call attempt. In free flight this second peak holds 3.1% of probability, more than in the waypoints family (1.3%). All 18 free-flight runs show it. The sharp spike at 26.3° S comes mostly from one run. The free-flight family carries 0.13% of the combined result. Few independent paths carry the northern peak, so its exact shape is uncertain. The project lead accepts run J as converged (16 October 2026).

Technical: core run J (tag run-j = 1244b7c, deskstar x86_64), family run-j-free, 18 seeds × 7M particles, BTO+BFO case, weighted particle histograms with 0.1° Gaussian smoothing, latitude of the final state (00:19:37, 7th arc); ln Z −134.49 (waypoints −127.82, ln BF 6.68; posterior share 0.13% at equal family prior). Highest 1° band 27–26° S 0.76%/deg, lowest 32–31° S 0.21%/deg (ratio 3.6; 2.9 without seed 1). Pooled spike at 26.30° S (1.12%/deg) is 59% from seed 1. Mass 31.5–25° S 3.1% (per-seed mean 3.3%, SE 0.5, range 1.1–8.2%); 28–25° S exceeds 32–30° S in 18/18 seeds. Pooled r-weighted effective lineages north of 33° S about 81 (r = waypoints D0 evidence ratio, approximation; one lineage 7.6% of northern mass). Split-half all-partition mean 0.873, 8-seed subsets 0.819; PASS by project ruling (16 Oct 2026). BFO sd 4.3177 Hz; 18:25:27 R600 held out; kappa_x N(1.0, 0.046) PROVISIONAL; one-engine s7 + s8 PROVISIONAL; 00:19 core treatment both BTO, no BFO. No drift, searched-area or end-of-flight evidence. Built 18 Oct 2026.
