

Plain (ASD-STE100): Run J does not use the 18:25:27 signal. Here we show what changes if we use it, for the Davey-dynamics family. The curve has two peaks, near 37.4° S and 36.0° S. The peaks stay in place. A small part of the probability moves from the northern peak to the southern peak. The mean latitude moves 0.2° south, but this shift is not significant (panel b: each dot is one seed, with and without the signal; bar: mean ± 2 standard errors). The median moves more (about 0.4°) only because it is between the two peaks. An earlier statement of a 0.46° change is withdrawn.

Technical: core run J (tag run-j = 1244b7c), run-j-repro-radar seeds 1–8 (3.5M each) against companions run-j-repro-r600bfo and run-j-repro-r600 (18:25:27 R600: BFO 142 Hz sd 4.3177 Hz; BTO 12,520 µs sd 62), same seeds. Paired mean-latitude shift −0.20 ± 0.12° (t −1.7, BFO) and −0.22 ± 0.18° (t −1.2, BTO+BFO); median −0.25 ± 0.15° and −0.38 ± 0.20°; mass in 34.5–36.5° S −0.05 ± 0.04 and −0.11 ± 0.04 (t −2.9), i.e. an inter-peak likelihood ratio of about 0.63. Pooled peaks 37.35/35.90° S -> 37.45/36.20° S; density at the median 0.28 per degree. Held-out ln p(BFO) −2.95 ± 0.05, ln p(BTO | BFO) −5.76 ± 0.07 (≈0.9σ, 1.2σ). Repro family only (posterior share 0.0003); waypoints family not tested. Stack: BFO sd 4.3177 Hz; kappa_x N(1.0, 0.046) PROVISIONAL; one-engine s7 + s8 PROVISIONAL; 00:19 core treatment both BTO, no BFO. Convergence: PASS by project ruling (16 Oct 2026). Grey band: Davey shoulder 34.5–36.5° S. Built 18 Oct 2026; supersedes panel c of run-j-comparison-and-r600.
