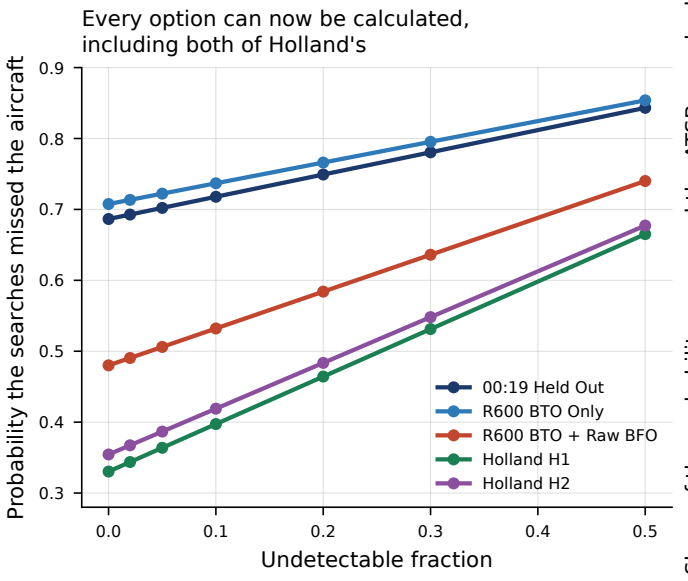
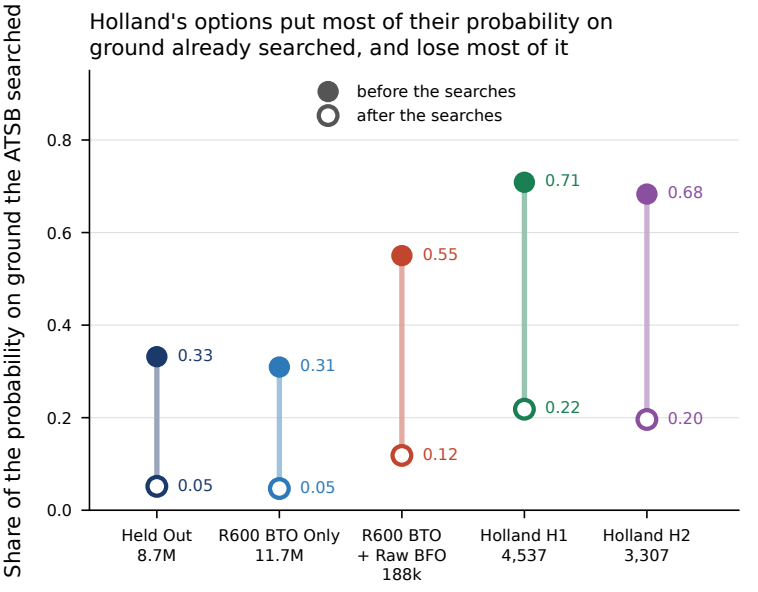
The seabed searches weigh most heavily against Holland's two readings of the 00:19 transmissions





WHAT THIS SHOWS. The 00:19 transmissions can be read five ways, and until this set of flight paths two of them - the two Holland put forward - could not be calculated at all: too few of the simulated flights could produce them. They can now. Left: the probability that the searches missed the aircraft, for each reading, against the fraction of sea floor where the wreck could not have been found even though the sonar looked there. Right: Holland's two readings place about 70 per cent of their probability on ground the ATSB already searched, against 31 to 55 per cent for the others, so the searches take most of it away, down to about 20 per cent. That is the strongest disagreement in the set, and it is new. Provisional.

TECHNICAL. Source: end of flight run D-he ("make H1/H2 estimable"), 4 strata x 4 seeds, 51,200,064 impacts, stratum weights 0.594 free / 0.235 Davey dynamics + radar / 0.153 descent-climb / 0.019 routes (end of flight's holland-sweep-summary.json), constraint +alive, PRIMARY arm (survival factor 1 - P(in-flight breakup before 00:19:37) applied to the posterior weights, architecture 20:55Z 11 Oct). Without it, Z is 0.6501 / 0.6566 / 0.4798 / 0.3641 / 0.3077. One mh370 evaluate pass per seed over eight coverage layers; each scenario is exact algebra on the raw coverage columns, checked against evaluate's own no_find_probability on every seed (max |delta| < 1e-12). Likelihood P(no find | y) = rho + (1 - rho) prod_k [1 - c_k(y) g_k q_k], point target, shared miss dependence, raster 0.01 deg bilinear. ATSB Phase 2 union 120,486.5 km2 at q 0.945; Bluefin-21/Artemis 771.4 km2 at q 0.900 (it removes 0.0000 at every rho); Ocean Infinity layers excluded. Effective sample size is the Kish value after the searches, against this module's floor of 1,000. Z split-half (seeds 1-2 against 3-4) 0.699/0.706, 0.718/0.726, 0.497/0.515, 0.352/0.375, 0.363/0.411. LABELS end of flight physics PROVISIONAL: piloted rapid descent to 40,000 ft/min with unloading in eligible shapes, stepped shapes NOT eligible (declared gap); INTERIM parametric pitch-down; residual roll P(left) = 0.8 PROVISIONAL; trim at loss, push-over and Boeing sequence APPLIED and PROVISIONAL; in-flight structural outcome PROVISIONAL, VD/MD declared, no transonic drag rise; breakup P 0.93 / 0.88 PROVISIONAL. COVERAGE GAP: family A1 under H1 and H2 has only 136 and 59 effective impacts, so the family split within those two columns is not estimable even though the columns themselves are. rho = 0.05 has no published value.
