Where the aircraft hit the water, before and after the seabed searches, for each 00:19 data option
(contact speeds of 212 m/s or less, groups weighted by the 00:19 data)

PROVISIONAL: run C NOT CONVERGED (free split-half 0.918 vs 0.924)

IN SIMPLE WORDS. Each column uses the 00:19 radio data in a different way. The top row shows where the aircraft hit the water. The bottom row shows the same after the seabed searches, which found nothing. Dark to light, the bands hold 50, 90 and 99 per cent of the probability. The searches take probability away from the searched ground, so the region usually gets larger. Impacts faster than 212 m/s are removed, because the model has no limit for structural failure. Columns 4 and 5 do not have sufficient samples. The calculation is not yet stable, so all values are provisional.

TECHNICAL. run C NOT CONVERGED (free split-half 0.918 vs 0.924). Source: end of flight's run C sweep (4 strata x 8 seeds, 102,400,064 impacts) on core run C 00:11 hand-offs. Core P(family) passed in: free 0.589, Davey dynamics + radar 0.252, descent-climb 0.135, routes 0.024. Search likelihood: module run.toml (ATSB Phase 2 + Bluefin-21, detection probability 0.945 / 0.900, undetectable fraction rho 0.05, point target, Ocean Infinity excluded). 00:19 options with end of flight's +alive constraint (Holland H1: start-up offset, fuel-exhaustion log-on). End-of-flight labels: rapid descents above 6,500 ft/min and unloading not reachable by the model; residual roll P(left) 0.8 PROVISIONAL; trim at loss and two-tank takeover not applied. Compact impacts rebuilt for mh370 evaluate by the Pleiades stub (position only). No wreckage-field coverage (no run C settling samples). Architecture stand-in run; module to review. This page: contact speed |v| <= 212 m/s (1.25 VMO, ruling 20:35 -0600 10 Oct), weights re-normalised per seed; strata mixed by P_core x Zhat_00:19(stratum, option, ~v212) from end of flight's family_evidence.per_seed. 50/90/99 % HPD on a 0.02 deg grid smoothed at 0.1 deg; areas on the authalic sphere. ESS = Kish effective sample size of impacts, summed over seeds; not estimable if impact ESS or effective parents < 1,000.
