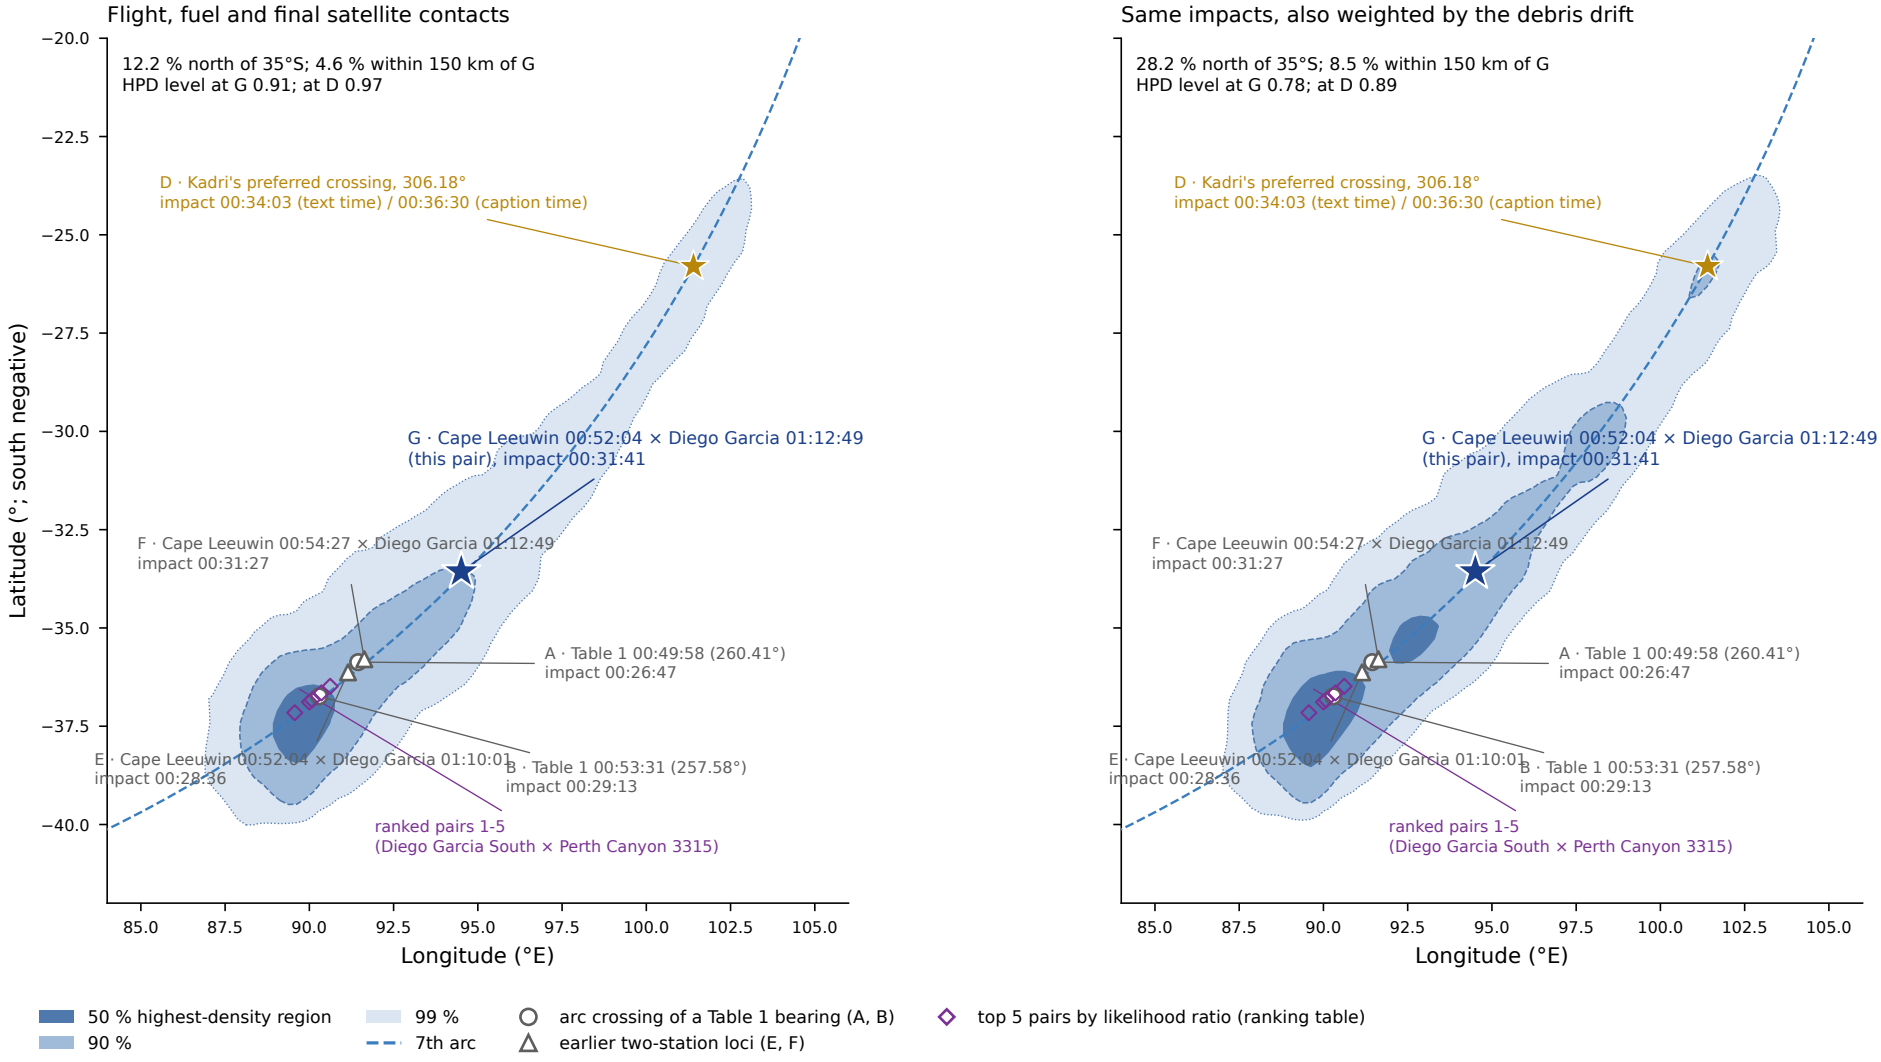
The pair locus G lies on the edge of the 90 % region without drift and inside it with drift; the five highest-ranked pairs all point further south, near 37°S



(i) The maps show where the aircraft most probably is on the sea floor. Left: from the flight, fuel and satellite data. Right: the same, also with the debris drift. The blue star G is the point that the two sounds give. The letters show the earlier candidates. The five diamonds are the pairs with the highest likelihood ratio in the new ranking table; all five have a likelihood ratio below 1 and G is number 104. The two sounds (Cape Leeuwin 00:52:04, Diego Garcia 01:12:49) have a time difference that agrees with one point on the arc, 33.6°S 94.5°E. Pairs like this occur by chance: the test gives p 0.019 from 36 tests, which is a chance level. The Diego Garcia sound is not kept when the airgun noise is removed. The sound direction that Kadri published for 00:52 does not point to this place. The impact would need about 330 times more sound than the calibration crash gives.

(ii) Pair G: Cape Leeuwin H01W 00:52:04 UTC (DIGITISED Kadri 2024 Fig. 9 panel c; envelope matched filter M1b p 0.043; Kadri's 'text time 00:52:03', 'caption time 00:54:30') x Diego Garcia South H08S 01:12:49 (DIGITISED panel e, raw, M1b p 0.039; the airgun-suppressed residual does not keep it, p_B 0.30); lag 1,245 s inside the predicted 809-1,536 s; 19 lag-consistent pairs vs 8.8 expected, permutation p 0.019 over 36 receiver-pair tests (chance level: a smallest p this low arises about half the time). Arc locus 33.6°S 94.5°E, implied impact 00:31:41; eta for P_D(both) = 0.5 is 0.069 = 330x the F-35A anchor 2.1e-4. BEARING: the locus lies at 269.0° from H01W (1,812 km) and 144.8° from H08S (3,657 km), WGS84; Kadri gives 57° (text p. 9) or 306.18° (Table 1 caption) for the 00:52 signal; neither is within 37° of the locus bearing; nearest Table 1 row 00:52:50 at 274.84° (46 s later). Maps: composer run-j-views-v3.2 maps-v3.npz, keys 'D0|core' (satcom + flight + end of flight, settled seabed) and 'D0|D' (core + debris drift, finds only, dedicated arc-latitude run), equal-area 769 km² grid (results/composer-views-run-j/views_common.py), each normalised to 1; HPD level at a point = mass of cells at least as dense as the point's cell (smoothed); HPD on cell mass after Gaussian display smoothing sigma 25 km. Ranked pairs: graphics-2026-10-22/ranked/ranked_pairs.csv (parallel ranking track; ranks by lnLR; top 5 are H08S × 3315 secondary-family rows, lnLR -0.64 to -3.42, loci 36.5-37.2°S 89.6-90.6°E); pair G is rank 104 by lnLR (-6.23) and rank 54 by p, bearing INCONSISTENT. Loci A, B from searches named/table1_verdicts.csv; E, F solved from the lag on the TL-grid arc; locus C of the earlier chart is not legible and is not redrawn; searched-area outlines of the earlier chart are not drawn. Source posterior run J, 00:19 Held Out (D0'), dive probability p 0.5; PREDICTIVE, NOT CALIBRATED; caveats C1 (propagation slope misfit, +10.4/+7.4 dB per octave at H01W/H08S) and C2 (coupling efficiency not calibrated; eta swept over four decades, F-35A upper anchor). Module branch hypothesis/hydroacoustics 9b27786; searches results-data/searches_run_j.
