

STE100: The maps show how well the 2014–2017 seabed search could find the wreck at each place. (a) and (b) use ATSB data and the shape of the seabed. (c) shows where the remaining probability goes when these maps replace one fixed value. Blue: less probability. Red: more probability.
Technical: ATSB Phase 2 covered ground, 0.005° grid. (a) q = 0.95(1−f) + 0.70 f, f = lower-confidence fraction from ATSB 2017 Fig. 73 (printed p. 96), digitised and scaled to each sub-area's printed share. (b) ρ = 0.05·w, w = terrain weight (Phase 1 150 m bathymetry), mean 1. (c) Core run J × seabed searches, 00:19 R600 BTO + both BFOs as recorded (D3), settled wreckage, both-burst waypoints set (0.998 of mixture weight); per-cell model V1 minus scalar base V0 (q 0.945, ρ 0.05), 0.2° bins, impact positions. Ocean Infinity coverage inferred (grade C), included as best estimate. Core run J accepted as a pass by project ruling, 16 Oct 2026.
