

Note 1: These maps show only one type of flight end: the engines stop for lack of fuel and nobody controls the aircraft. A new set of simulations was aimed at this type, because the main run had too few independent samples for it when both 00:19 frequencies are used as recorded. The new set agrees with the main run where both can be compared. The search result is not applied. Theflight model for a descent without control is not calibrated, so these results can change.
Note 2: A1 no-intervention branch (onset flame-out-associated, control no intervention): conditional pass on core run J waypoints (accepted as a pass by project ruling, 16 Oct 2026), seeds 1-8 x 100,000 hand-off particles, 16 children x 4 descents, D3-aimed scored selection (K = 8; BFO-model priors 0.98/0.01/0.01; exact correction), production laws (round-3, bank limit U[52,90] deg, dive p = 0.5), mh370-eof-rj1; seeds 2-8 Horvitz-Thompson thinned to 1M rows. Stratified estimator Z(d, branch) = Z(D0') P_D0'(branch) E_D0'[L_d | branch]; shares = branch + A1 outside the branch (production). q = 1/3, C2 silent. Uncontrolled-arm dynamics NOT CALIBRATED (Boeing leave-one-out gate failed in all three rounds).
