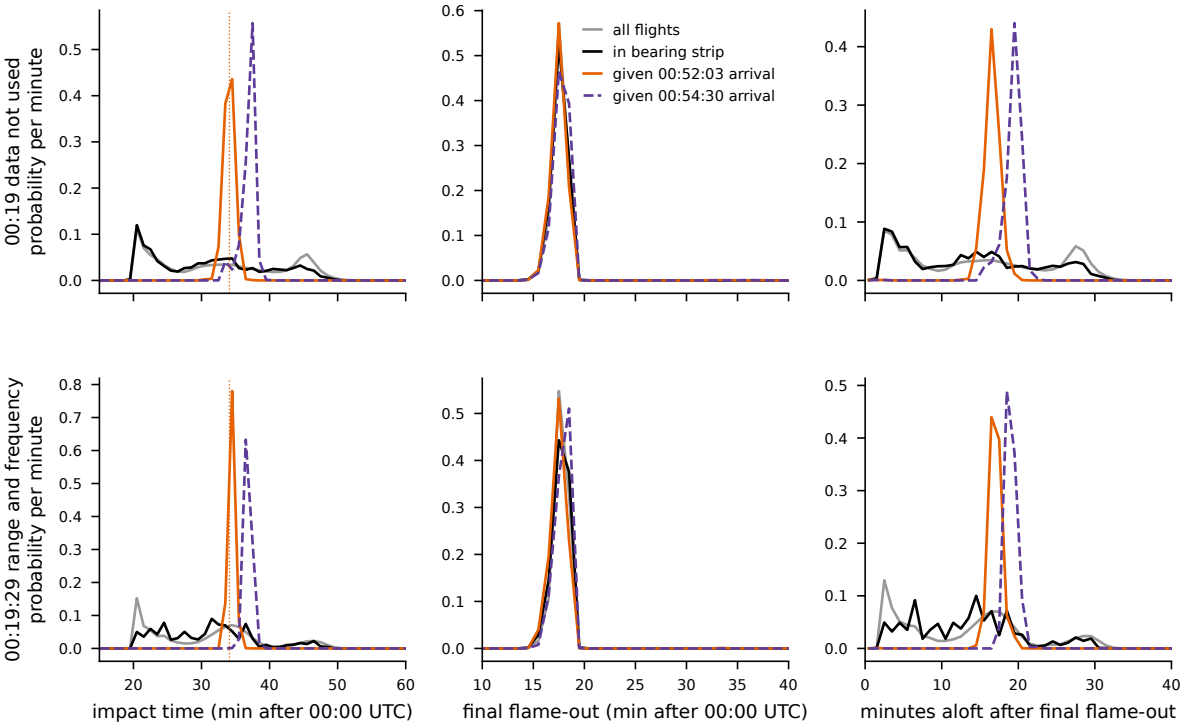
Flights that fit the H01W sound end in a 15-20 min glide after fuel exhaustion at about 00:17-00:18



(i) Plain: Lines show how often each time occurs. Grey: all flights that agree with the satellite data. Black: flights that end in the strip along the bearing. Coloured: flights weighted by agreement with the sound. The dotted line at 00:34 is the impact time for an impact on the arc at the bearing (text reading). Flights still powered at impact are not in the right-hand panels. Searches, drift and other evidence are not used.

(ii) Technical: end-of-flight run J, cells "D0/D2 total q=0.333 (C2 silent)", four strata mixed by core P(family); strip = 1,531-1,841 km from H01W, |cross-track| <= range tan 1 deg; conditional = w_i L_i with s_b = 1.0 deg (pre-registration Q2); 1-min bins; times from compact T0 = 1394236800 (00:00:00 UTC). Conditional effective samples 166 / 14 (D0) and 24 / 14 (D2): NOT ESTIMABLE as shapes. Physics PROVISIONAL; no search, drift or ocean model.
