
Plain English. Each panel shows one type of evidence. Grey: the impact position from the satellite data, the aircraft performance model and the end-of-flight model (all four flight families, mixed by their probability). Coloured step line: the same evidence alone, with every position on the 7th arc at 00:19:29 equally probable before the evidence (40.6-11.8 S, the reach of the run J flight paths); the end-of-flight model then gives the impact. The samples for this line come from the satellite result, so few samples carry the north: bars show 2 standard errors from the seed scatter. Dashed: the module surface along the arc, with one fixed end-of-flight displacement. Black: all evidence together. The 00:19 data are held out. The 00:19 log-on cause: fuel exhaustion or another cause (prior odds 1 to 3); under the other cause the aircraft is silent. The end-of-flight physics is not calibrated. Searched areas use the impact point, not the seabed. Hydroacoustics gives no contribution. The Pleiades and the Australian panels are conditional or sensitivity results, not headline: a conditional PDF carries no Bayes factor.

Technical. Core run J (tag run-j 1244b7c), four strata mixed by core P(family) at equal prior (waypoints 0.9982); EoF run J run-i-dive recipe, round-3 laws, bank limit U[52,90]; cell 'D0 total q=0.333 (C2 silent)' via option_table_0019.seed_terms; seeds pooled by evidence. Drift: run A rebuilt node surfaces, 50 km kernel, GLORYS12V1 + ERA5 and GlobCurrent + ERA5 (product-relative windage), equal prior, marginalised jointly with Pleiades per row; nine finds. Searched areas: seabed_loglik.py (lib.rs transcription), rho 0.05, Phase 2 q 0.945, Bluefin-21 q 0.9; Ocean Infinity layers excluded. Pleiades: joint-surface-rho0.25-gcrel (P + COSMO F1-F4). Australian term: populated coasts, reconstructed law (k, c refitted), post hoc. Not-computed rows carried at the (seed, option) mean (ruling 15 Oct). Reweighted views: r = u/q per 10 NM bin of the 00:19:29 arc position (circle about 0.57 N 64.25 E, radius 44.50 deg); Kish ESS drift 2066, searches 1165, Pleiades 61551, Australian 1996; 0.0 % of the arc span has no proposal mass. Run J split-half accepted as a PASS by project ruling, 16 Oct 2026.
