
Probability density of the impact latitude on the 7th arc from the debris drift evidence alone, with a prior that is uniform along the arc, compared with the density from the satellite communication and flight data (Davey model with the fuel model; no measurement at 00:19 used). Drift evidence: twelve items on all western Indian Ocean coasts with four detection periods; two ocean models with equal weight unless stated. The drift curves are smoothed along the arc by a Gaussian-process fit to the 84 release points. No finds on Australian coasts: detection on populated Australian coasts 0.25 of that on the find coasts. The two-model curve lies close to the GlobCurrent curve. Medians: satellite and flight data 36.4 degrees south; drift alone 30.0; with no finds on Australian coasts 29.5; GlobCurrent only 30.0; GLORYS12 only 29.4; without Mossel Bay 32.9. Range of the drift-alone median from resampling the ocean samples (5 to 95 per cent): 29.6 to 30.4 degrees south. Disagreement between the drift evidence (two ocean models) and the satellite and flight data: 1.6 standard deviations (1.5 to 1.7 over ocean samples; 1.6 to 1.9 over ocean models and the Australian assumption).
