

What the fuel model does: 6temper-realloc against the most convergent fuel-free run
The fuel model moves the terminus north and triples the northern shoulder

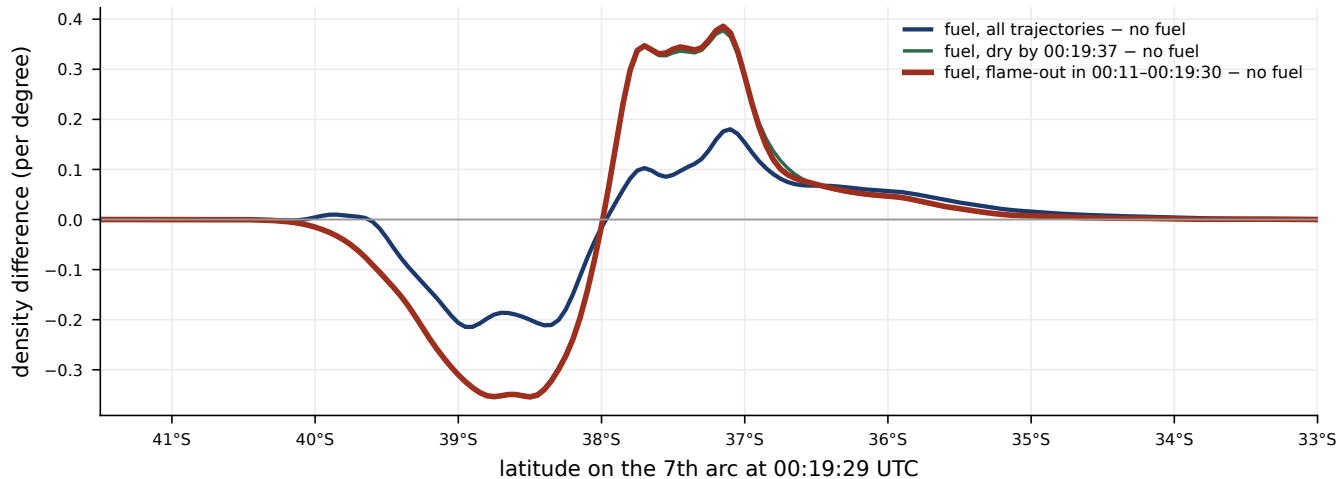

a

no fuel model — tempered-three	median -38.157°	50 % HDI width 1.20°	shoulder 0.0352 (14.6 % of Davey)	split-half 0.9551	PASS
fuel, all trajectories	median -37.661°	50 % HDI width 1.10°	shoulder 0.1042 (43.3 % of Davey)	split-half 0.9109	fail
fuel, dry by 00:19:37	median -37.477°	50 % HDI width 0.70°	shoulder 0.0843 (35.1 % of Davey)	split-half 0.9053	fail
fuel, flame-out in 00:11-00:19:30	median -37.476°	50 % HDI width 0.70°	shoulder 0.0859 (35.7 % of Davey)	split-half 0.9028	fail

b

Each fuel variant minus the converged fuel-free posterior

fuel, all trajectories	total absolute difference from no-fuel	0.4794
fuel, dry by 00:19:37	total absolute difference from no-fuel	0.8619
fuel, flame-out in 00:11-00:19:30	total absolute difference from no-fuel	0.8650
the no-fuel run is the only series that clears the 0.924 convergence floor
