
Probability density of the impact latitude on the 7th arc from the debris drift evidence alone, with a prior that is uniform along the arc, compared with the density from the satellite communication and flight data. (a) The drift evidence of twelve items on all western Indian Ocean coasts with four detection periods, the same with no finds on Australian coasts (detection on populated Australian coasts 0.25 of that on the find coasts), and the October 2026 calculation (nine finds, finds window to 30 June 2016). (b) The drift evidence by ocean model and without the Mossel Bay item. Medians: satellite and flight data 37.1 degrees south; drift alone 30.3 (October calculation 30.0); without Mossel Bay 32.4. Agreement of the drift evidence with the satellite and flight data: suspiciousness ln S = -1.39, tension probability 0.08 (1.8 standard deviations).
