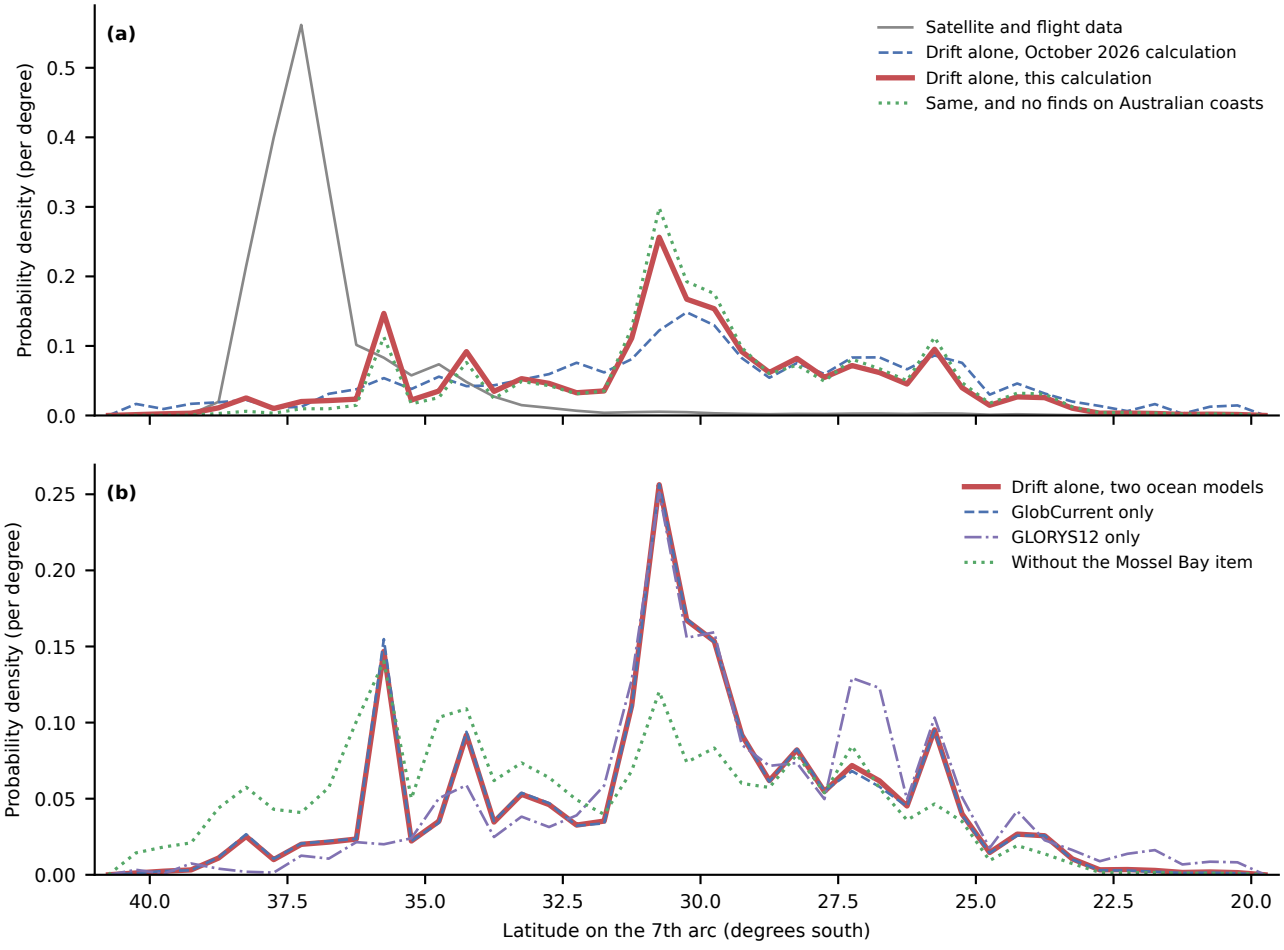
Drift evidence alone favours about 30 degrees south; the satellite and flight data favour about 37 degrees south



Notes. Drift: two ocean models with equal weight (GLORYS12V1 currents at 0.494 m with ERA5 wind; Copernicus GlobCurrent with ERA5 wind, wind factor reduced for built-in wind drift). 84 release points from 40.25 to 19.92 S; densities outside this span are not computed. Finds scored to 30 Jan 2017; detection levels log-normal (sigma 1) per coast and period, prior median 0.1 before 29 Jul 2015, 0.5 to 1 Mar 2016, then 1; 16384 draws. Twelve items weighted by identification grade (confirmed 1, almost certain 0.98, highly likely 0.9). Core: end-of-flight run J, 00:19 data held out. Tension statistics after Handley and Lemos (2019) on the evidence-ledger bins. Provisional physics.
