

**a**

What moves the resting field at 3,830 m: float time for floated classes; carry and glide for dense ones

**b**

(a) dot = seabed 3,830 m (posterior median); line = range over 3,500 / 3,830 / 4,070 / 5,800 m. (b) values printed where the change is  $\geq 15\%$ ; floating share alters what settles, not where (afloat mass share in the note). PROVISIONAL — analytic two-layer column, uniform surface fields, planar seabed at controlled depths; 256 draws per cell.
