

00:11:49 (posterior routes, 6th arc)

00:19:37 (final posterior, 7th arc)

Run next-run (b), 10 Oct 2026, deskstar x86_64, binaries 45650e2 (Davey dynamics, routes) and e65b0e7 (free, descent-climb relaunched after an OOM kill; same engine code for these strata), seeds 1-4, 3.5M particles per seed per stratum. Stack: davey2016-inmarsat (Inmarsat satellite states) + no-exhaustion-prior + fuel fixes s1-s6 (internal-v1, temperature term, kappa N(1.0004, 0.0196), 43,800 - kappa x 7,228 kg, weight-dependent ceiling, hard reject, two tanks as bookkeeping) + reference-snapshots + radar-full + family overlay. Prior 18:01:49 at 5.6248N 99.0482E, track 289.7 +/- 1.0 deg. Sampler with the request-17 ancestry fix. 00:19:37 = final posterior; 00:11:49 = stored posterior routes (2,000 per seed, unweighted). P = family probability, equal prior odds, from log of mean evidence over seeds. One-engine flight before 00:11 is NOT modelled in (b) (C-7(a) is the companion run).
