

1. Complexity after 18:40 against arc latitude (posterior probability)

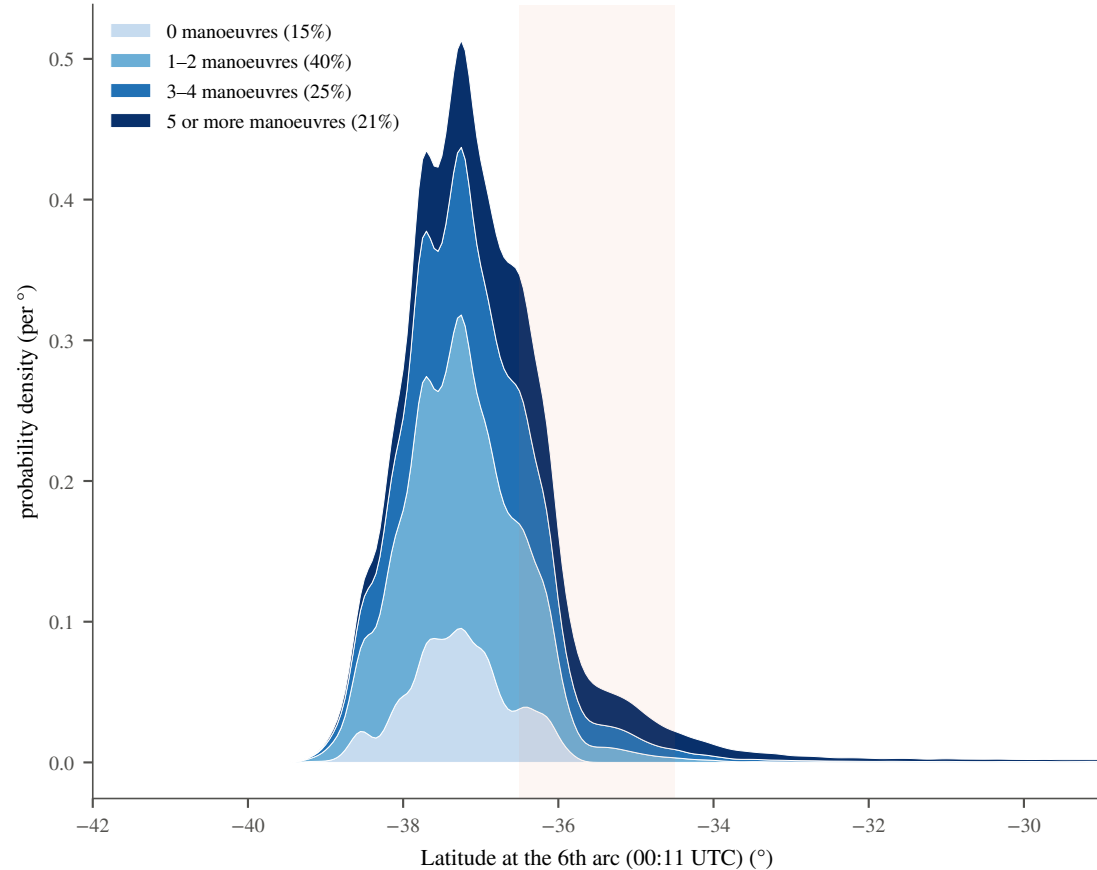

Posterior weights pooled over replicates 1, 2, 3, 4 (7M particles each, BTO+BFO). Complexity = turns + speed changes + altitude changes after 18:40. Prior: Davey et al. manoeuvre model (Jeffreys tau on 0.1-10 h, Poisson counts, durations neglected). Shaded band: the published shoulder 34.5-36.5 $^{\circ}$ S.

2. Latitude pdf split by complexity after 18:40 — 7th arc (00:19 UTC)

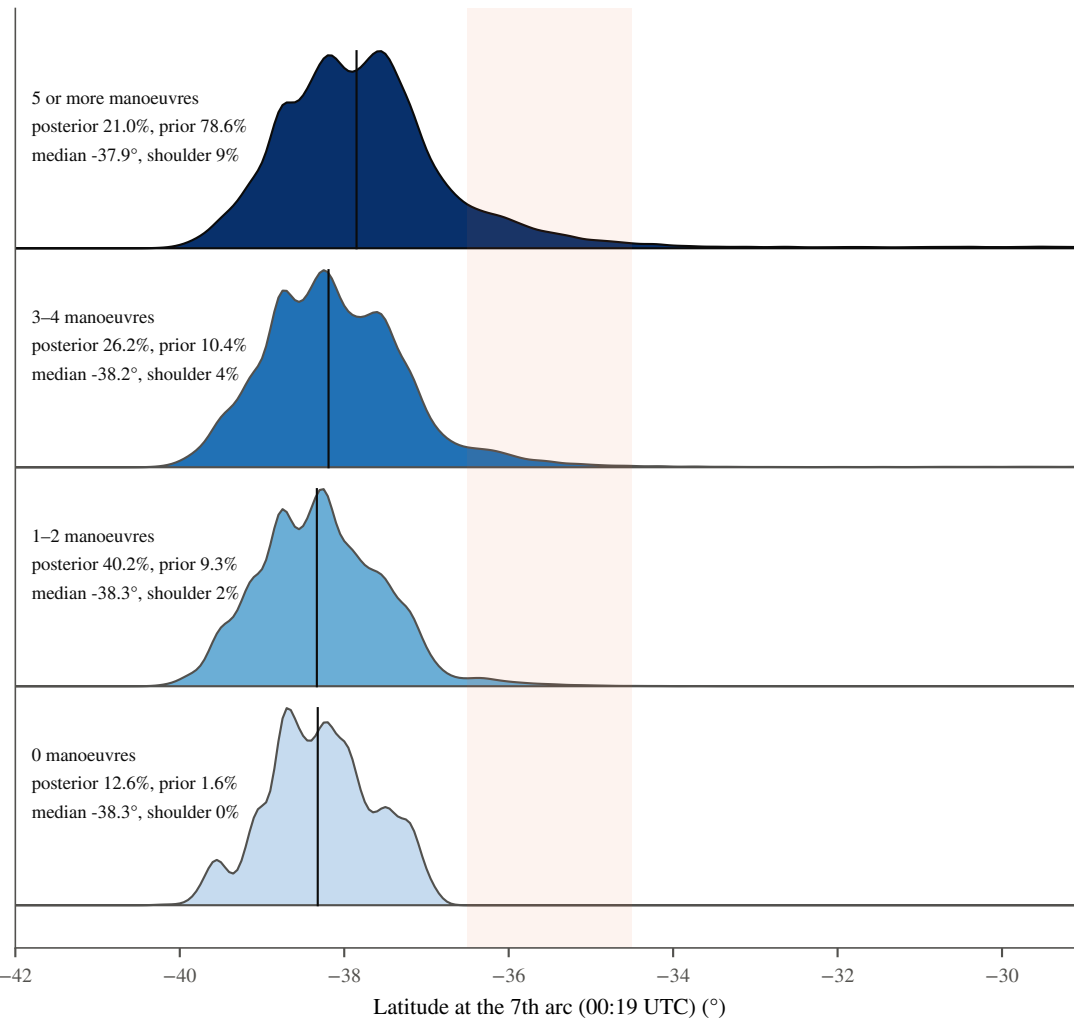

2. Latitude pdf split by complexity after 18:40 — 6th arc (00:11 UTC)

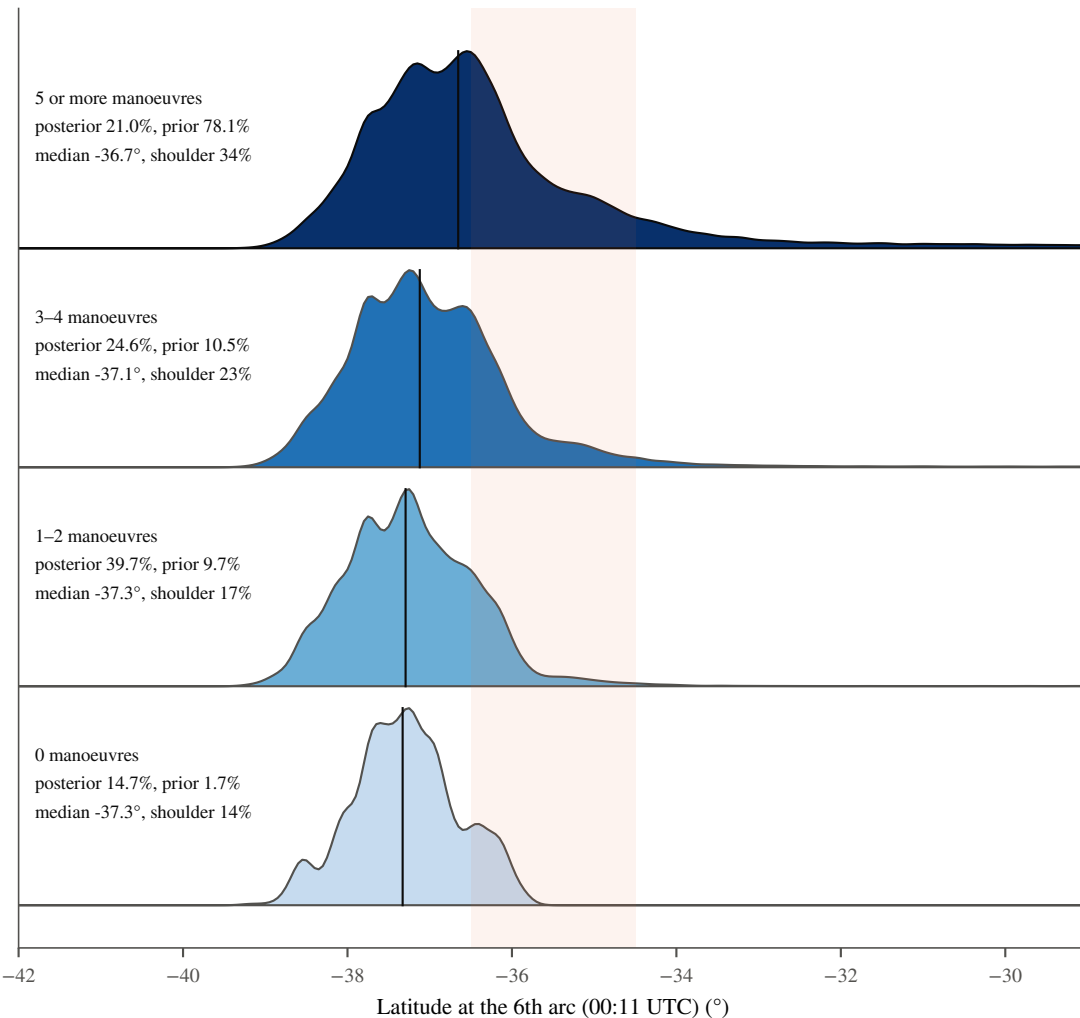

Stacked: each band is that class's contribution to the pdf; legend shows its posterior share. Posterior weights pooled over replicates 1, 2, 3, 4 (7M particles each, BTO+BFO). Complexity = turns + speed changes + altitude changes after 18:40. Prior: Davey et al. manoeuvre model (Jeffreys tau on 0.1-10 h, Poisson counts, durations neglected).

3. Latitude pdf of each complexity class (normalised) — 7th arc (00:19 UTC)

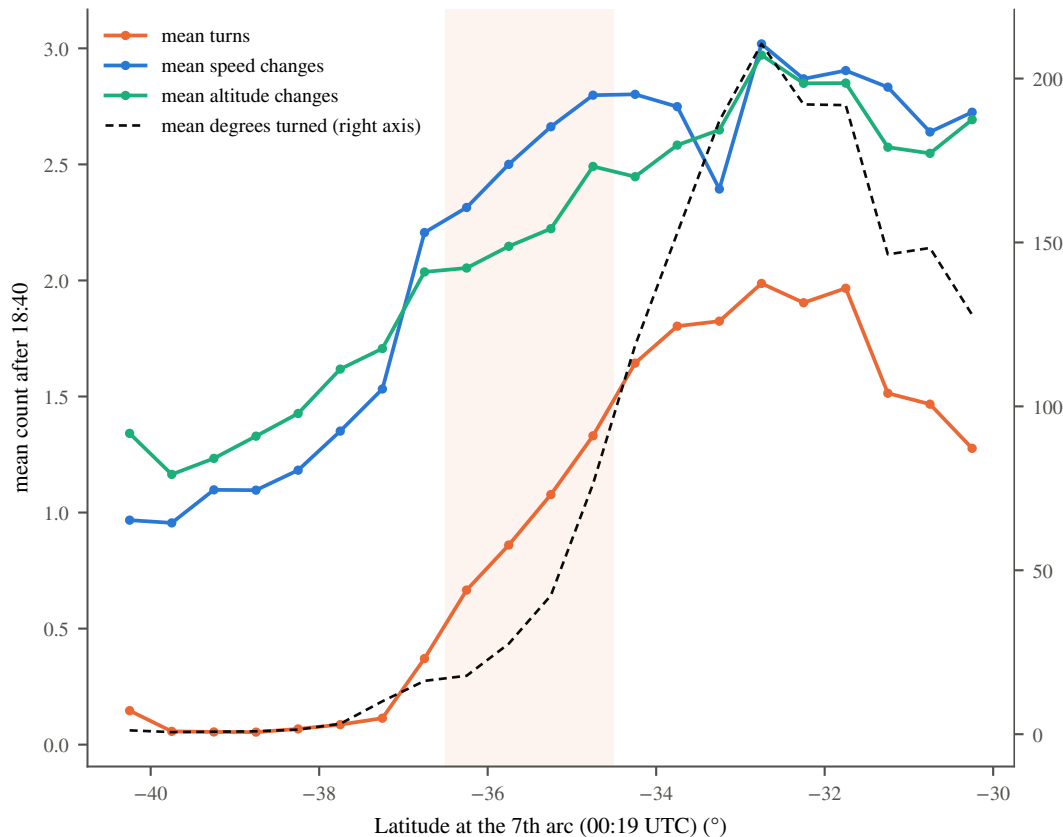

3. Latitude pdf of each complexity class (normalised) — 6th arc (00:11 UTC)

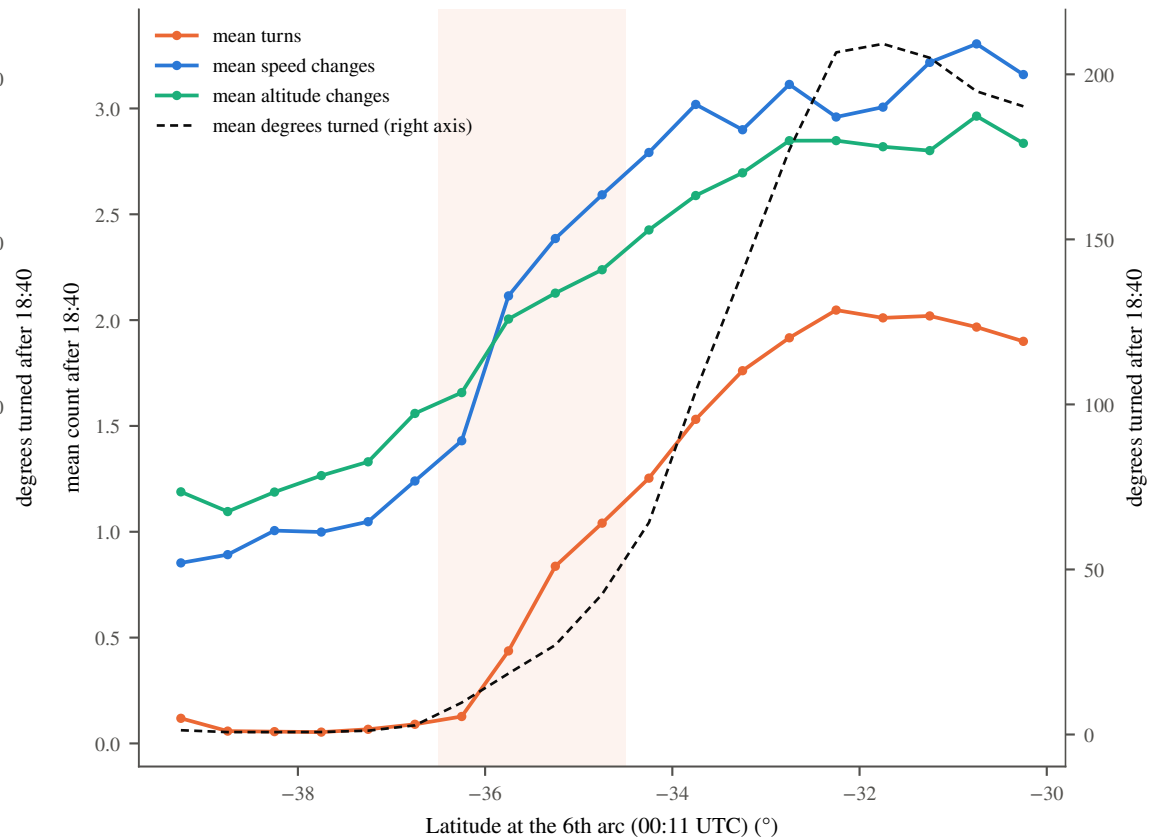

Each ridge is normalised separately, so shape is visible regardless of weight; vertical tick: median. 'Shoulder' is the class's own probability in 34.5-36.5°S. Posterior weights pooled over replicates 1, 2, 3, 4 (7M particles each, BTO+BFO). Complexity = turns + speed changes + altitude changes after 18:40. Prior: Davey et al. manoeuvre model (Jeffreys tau on 0.1-10 h, Poisson counts, durations neglected).

4. Manoeuvres by type against latitude — 7th arc (00:19 UTC)

4. Manoeuvres by type against latitude — 6th arc (00:11 UTC)

Posterior-weighted means in 0.5° latitude bins with at least $1e-5$ of the probability. Posterior weights pooled over replicates 1, 2, 3, 4 (7M particles each, BTO+BFO). Complexity = turns + speed changes + altitude changes after 18:40. Prior: Davey et al. manoeuvre model (Jeffreys tau on 0.1-10 h, Poisson counts, durations neglected).

5. How often a sparse filter reproduces Davey's shoulder by chance (base model, BTO+BFO)
