
Probability density of the impact latitude on the 7th arc from the debris drift evidence alone, with a prior that is uniform along the arc. Grey area: the density from the satellite communication and flight data. Drift evidence: twelve items on all western Indian Ocean coasts, with four detection periods; two ocean models with equal weight unless stated. No finds on Australian coasts: detection on populated Australian coasts 0.25 of that on the find coasts. The drift curves are not smoothed and contain sampling noise between neighbouring release points. The two-model curve lies close to the GlobCurrent curve. Medians: satellite and flight data 37.1 degrees south; drift alone 30.3; with no finds on Australian coasts 30.0; GlobCurrent only 30.4; GLORYS12 only 29.8; without Mossel Bay 32.4. Agreement of the drift evidence with the satellite and flight data: suspiciousness ln S = -1.39, tension probability 0.08 (1.8 standard deviations).
