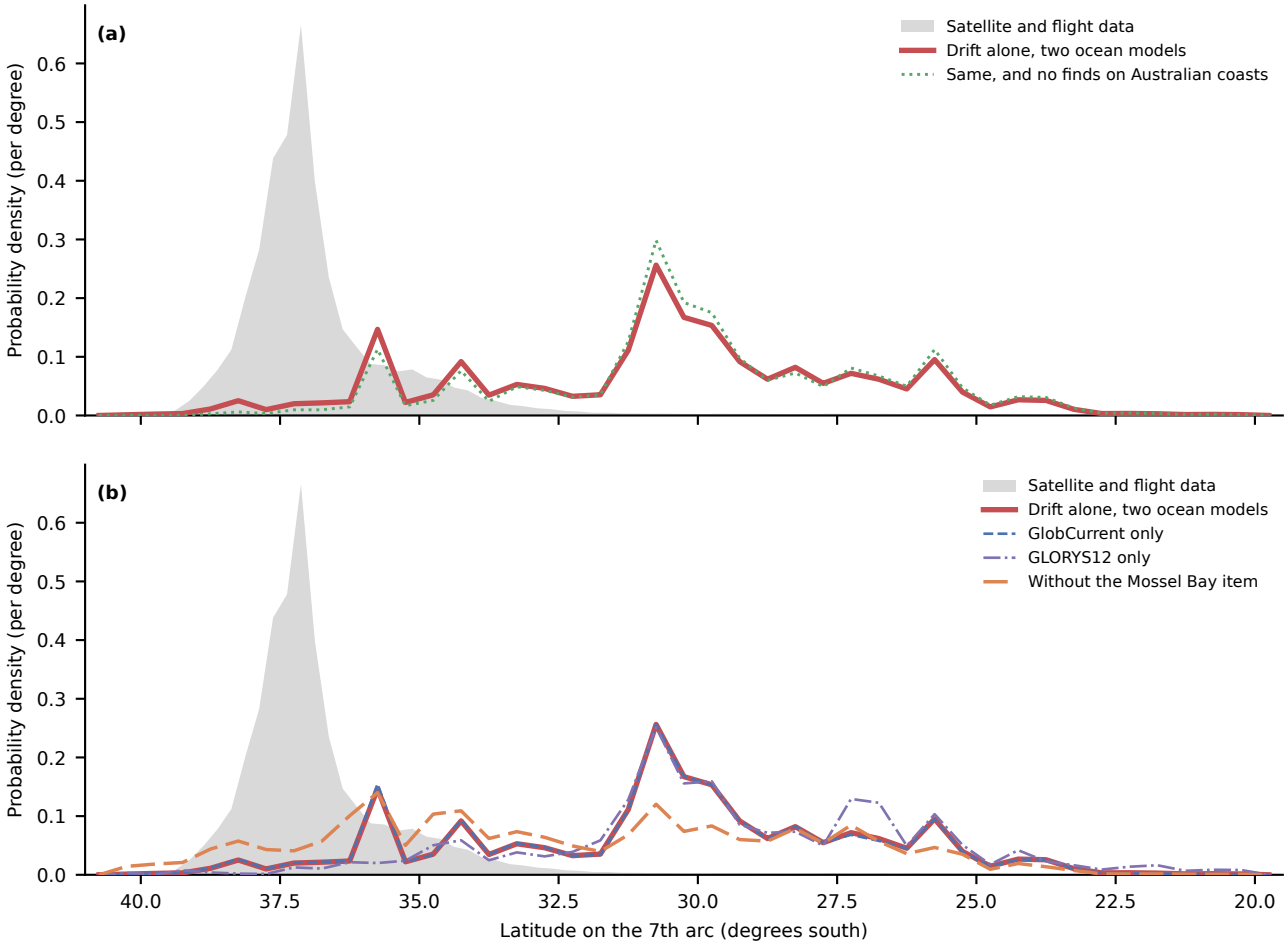
Drift evidence alone favours about 30 degrees south; the satellite and flight data favour about 37 degrees south



Notes. Drift: GLORYS12V1 currents at 0.494 m with ERA5 wind; Copernicus GlobCurrent with ERA5 wind, wind factor reduced for built-in wind drift; 84 release points from 40.25 to 19.92 S; finds scored to 30 Jan 2017; Mossel Bay dated at its first beaching (23 Dec 2015); detection levels log-normal (sigma 1) per coast and period, prior median 0.1 before 29 Jul 2015, 0.5 to 1 Mar 2016, then 1; 16384 draws; items weighted by identification grade (1 / 0.98 / 0.9). Core: end-of-flight run J, 00:19 data held out. Tension statistics after Handley and Lemos (2019). Provisional physics.
