

Where the aircraft hit the water, as each set of evidence is added

PIPELINE TEST - NOT CONVERGED (core (b) split-half). These curves show where the aircraft possibly hit the sea. Each curve adds more evidence. The orange curves are correct only if the Pléiades objects are aircraft debris. The input sample did not settle, so the curves can change in a new run. Do not use them as a result.

Technical: Source: core (b) filter, prior track 289.7 deg, 00:11 hand-off, 4 strata x 4 seeds (51.2 M impact rows); end of flight 3c6319f (dive class (b), descent rates <= 6,500 ft/min, PROVISIONAL); log-on cause 'other', +alive. Drift: GLORYS12V1 + ERA5 only, 50 km bandwidth, 9 finds (GlobCurrent excluded: audit F1). Hydroacoustics: stand-in L_hyd (IMOS 4 loggers + Kadri H01W list). Pléiades: rating 5, 6 clusters, equal weight, GLORYS12, COSMO excluded. Searches: Phase 2 + Bluefin-21, rho 0.05, OI excluded. Not-computed rows carried at the (seed, mode) mean likelihood ratio (drift 16-25 % of weight, Pléiades 1-3 %). Strata mixed by P(family) re-weighted by the 00:19 evidence. Holland H1/H2 not estimable and not shown. Curves: summary.rs latitude grid (0.05 deg, 0.1 deg Gaussian), pooled per summary.rs pooling().
