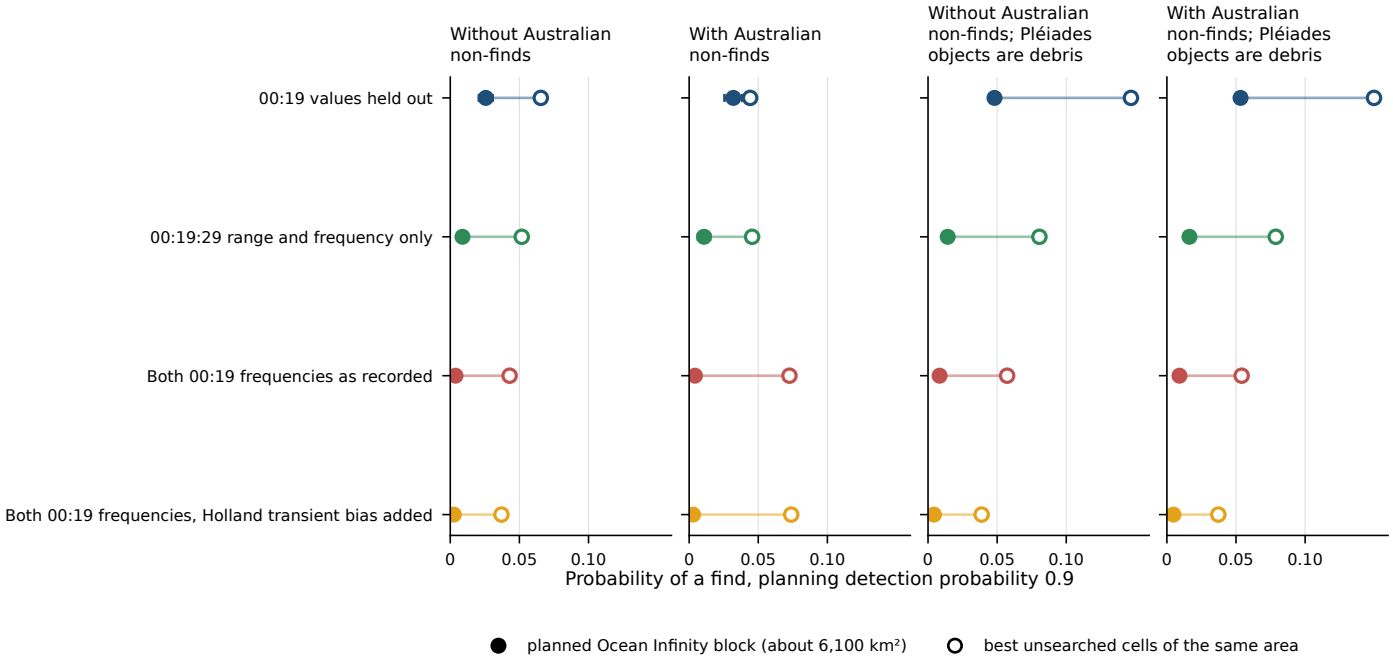
The planned block gives a lower probability of a find than the best unsearched ground of equal area, in every case



Pipeline test, before calibration, not for release. Source: composer views v3.2 on run J, re-run privately with extra maps saved (reproduces the published v3.2 output exactly). All posteriors include the core, the drift finds and the searched areas (per-cell detection model V1 central; Ocean Infinity 2018 and 2025–26 included, coverage inferred, grade C), settled seabed. Australian non-finds: populated coast only (city and inner regional at the find-coast level), the nearest stored column to the 17 Oct scheme (tiers 1/0.3/0 at level 0.5), which pulls slightly less far north. 'Given Pléiades objects are debris' = conditional on that hypothesis. Planned block: community tracing of the inboard band (grade C), 6,122 km² (official remainder 7,429 km²). Technical: Davey eq. 11.2, P_D 0.9; products DS, ApopS, DSP, ApopSP; error bar = approximate Monte Carlo SD by design effect (not assessed for the Pléiades-conditional posteriors); open circle = top cells with coverage < 0.1, not contiguous (upper bound).
