

a: GDP replay of 808 undrogued drifter segments (60 drifters), box 80-110 E 45-20 S, March-May starts, current + 1 % ERA5 (ocean transport, results/ocean-transport-error-gdp-replay.json); bootstrap 95 % at 15 d: 99-121 km east, 89-111 km north (GLORYS12). Lines: the OU variance likelihood. rs uses (run.toml). Red: the prior work's 5 NM/day random walk plus its 10 km kernel, read per component (an upper bound if 5 NM/day is the 2-D rms).

b-c: transport only, flat prior, no search; Pleiades rating-5 (equal weights) and all four COSMO contacts, 21 March dusk pass, 50:50 pool, windage 0 / 1.25 / 3 % - the prior work's settings - on GLORYS12 + ERA5 and GlobCurrent daily + ERA5 at equal weight. b uses 30 km per component, inside the 27-37 km the prior work's spread gives at 15 d under its two readings (90 % area 52,823-69,465 km², mode unchanged); c the measured OU spread. Prior work published: 90 % area 57,708 km², mode about 35.3 S 92.2 E.

Shading: 50/90/99 % HDR with black contours of decreasing weight. Conditional on H; no Bayes factor or P(H | data). GlobCurrent daily label provisional (P4).
