Seabed sonar covers the 7th arc from about 40° S to 25° S. Near the arc no aircraft or ship searched 35–37° S; at 23–26° S only Chinese ships searched, on 4–6 April

- Seabed sonar, ATSB 2014–2017 and Bluefin-21 (official)
- Seabed sonar, Ocean Infinity 2018 (inferred from ship tracks)
- Seabed sonar, Ocean Infinity 2025–26 (inferred from ship tracks)
- Ocean Infinity next block (planned, not searched)
- Within 25 NM of the arc, no seabed search
- Aircraft and ship search, 18 Mar–28 Apr 2014 (AMSA daily boxes)
- Chinese ships' task areas (assignments, not tracks)
- Haixun 01 ULD contacts, 4–5 Apr (discounted)
- Ocean Shield towed ULD search, 4–14 Apr
- Sonobuoy fields, 6–16 Apr (about 3,000 km² each)
- Satellite images with reported objects, 16–26 Mar
- Pléiades scenes 23 Mar; diamonds: radar contacts 20–21 Mar
- Regions known to be imaged by satellite (no footprints published)

STE100: This map shows all known searches for MH370 in the southern Indian Ocean. Brown and orange areas show where sonar searched the seabed. Ocean Infinity areas come from ship positions, not from official maps. Grey hatching shows ground near the 7th arc that no seabed search covered. Blue areas show where aircraft and ships searched the sea surface in 2014 (official daily areas). Dotted outlines show areas given to Chinese ships; we do not know how much of them the ships covered. Pink shows satellite images. Satellites could see all of this area each day, but no agency published where its images were taken. The second chart shows the searches for the recorder beacons.
Technical: Seabed: ATSB Phase 2 valid-pixel coverage (GA 5 m mosaics), Bluefin-21 (GA polygons), grade A; Ocean Infinity 2018 / 2025–26 = MH370-CAPTION outlines × AIS slow-fix density (σ 15 km) scaled to 112,000 / 7,571 km², grade C; next block = traced inboard band (6,388 km²), map layer only. Unsearched band = ±25 NM of the sea-level 7th arc (BTO 18,400 µs, 00:19:29) minus seabed coverage ≥ 0.5. Surface: GA/AMSA Search_And_Rescue_Search_Area2014, 387 daily boxes (no tracks or detection probability published), drawn semi-transparent over the seabed layers; within 25 NM of the arc the share covered by these boxes is 0.00–0.01 at 35–37° S and 0.00 at 23–26° S. Chinese task areas (Xinhua; PRC MFA 31 Mar 2014): 26–34° S, 91–104° E from 30 Mar; 20–26° S, 101–104° E set 4 Apr, searched by Haixun 01, Jinggangshan and Kunlunshan 4–6 Apr; not in the AMSA boxes. Haixun 01 reported 250,000 km² searched over its 216-day deployment. ULD = underwater locating device (ICAO Annex 6 term; ATSB: ULB). Satellite: DigitalGlobe 16 Mar, Gaofen-1 18 Mar, Airbus/MRSA 23 Mar, THEOS 24 Mar (provisional), Japan IGS 26 Mar (10 km circle); Pléiades scenes (GA Record 2017/13, 25 × 20 km); radar contacts F1–F4; tinted regions per ATSB 2017. Daily MODIS/VIIRS and geostationary images covered the whole map but cannot resolve debris.
