

Drift pilot, PROVISIONAL (land-mask beaching, one product, K = 248 m²/s; 1709 nodes). Not evidence.

Run: drift pilot, pilot.toml at 4311e7c (base config/davey2016.toml), 4 interleaved chunks at 2 threads. Extent: core run no-exhaustion-prior, 00:19:37 map, prior track 295.66 deg (superseded by reference-289); no impact samples used, so no 00:19 option or BFO model applies.
Ocean model glorys12v1+era5-wind10 (GLORYS12V1 surface currents, ERA5 10 m wind), RK2 6 h, K = 248 m²/s, no ocean-error field; one environment seed (1); 1,709 nodes at 10 NM, 3,334 particles per class per node (flaperon, low-exposure exterior, high-windage interior); 17,093,418 trajectories.
Assumptions (PROVISIONAL): beaching = product land-mask stranding (no coastline; Rodrigues cannot strand - structural zero); single angle on both wind terms (pre-D-f API); G1 levels In nu ~ N(In 0.1/0.5/1, 1); exponential discovery delay 60 d; kernel 50 km (25/100/200 km sensitivities), 6 sigma cut-off. Not evidence.
