

Each dot = one H01W $\times$ H08S pair from the pre-registered count (bf97e70): its implied source = prior-weighted mean location given the pair's H08S–H01W time difference and absolute H01W arrival (impact 00:19:37 + 300 $\pm$ 180 s; $c = 1.482 \pm 0.006$ km/s; pick sd 10 s; panel b adds Kadri's H01W bearing, Student-t sd 3.3°). Dot size $\propto \log_{10}$ BF vs a chance pair. H01W lies to the east and H08S to the north-west. Strings = one H01W trigger paired with successive H08S shots of the 9.98 s airgun-like train. Data: Kadri (2024) Fig. 9 vectors (filtered 2–40 Hz, single channel), not raw IMS. Grey = impact prior: stand-in from run no-exhaustion-prior (b3dd44b), prior track 295.66° $\pm$ 1.0°, config sensitivity/no-exhaustion-prior.toml, σ_x 20 NM. EXPLORATORY; p from 1,155 burst-preserving time slides of the H08S triggers.
