

What moves the resting field at 3,850 m: float time for floated classes; carry and glide for dense ones

(a) dot = seabed 3,850 m (reference-289 posterior median); line = range over 3,360 / 3,850 / 4,340 m (reference-289 p10 / p50 / p90) and 5,800 m (ATSB p. 49 maximum north of Broken Ridge). (b) values printed where the change is $\geq 15\%$; floating share alters what settles, not where. PROVISIONAL — analytic two-layer column, uniform surface fields, planar seabed at controlled depths; 256 draws per cell.
