

00:11:49 (posterior routes, 6th arc)

00:19:37 (final posterior, 7th arc)

Run next-run (a), 10 Oct 2026, deskstar x86\_64, binary e65b0e7, seeds 1-4, 3.5M particles per seed per stratum (seed 4 of Davey dynamics and descent-climb re-run after a full-disk failure, same binary and configs). Stack as (b) - davey2016-inmarsat + no-exhaustion-prior + fuel fixes s1-s6 (internal-v1, two tanks) + reference-snapshots + radar-full + family overlay - plus C-7(a) one-engine dynamics (s7): after the first flame-out a constant drift-down U(300, 1000) ft/min to the one-engine ceiling at LRC INOP Mach (PROVISIONAL; ceiling derived by core). Live-engine flow from internal-v1 grid\_inop AS DELIVERED, which is 2x its source tables (core finding 10 Oct): one-engine phases are about half their true length. Prior 18:01:49 at 5.6248N 99.0482E, track 289.7 +/- 1.0 deg. P = family probability, equal prior odds, log of mean evidence over seeds. Split-half not converged except routes (0.946).
