

Plain: Debris from impact points further south would often have reached Australian coasts, where nobody found any. Panel a shows how much this lowers the score of each point; panel b shows how it moves the most probable impact area north. The ocean model stops at 120 degrees east, so debris drifting further east is not counted. The results are interim and are not evidence.

Technical: Australian non-recovery pilot, GLORYS12+ERA5, 178 of the 710 run A nodes, 1e5 particles/node, binary 56be04bc3c8c605f; 10 Australian segments by ABS RA 2021 class; levels pre-registered (B: city+inner ln 1, outer ln 0.3, remote ln 0.05; A: as find coasts 0.1/0.5/1 by period; C: 0.3/0.1/0.02); sigma 1; window to 30 Jun 2016; domain 15-120 E (REACH-LIMITED); beaching GSHHG snap 25 km, no refloat. b: composer pass 2 run I map D1|T|DrS|M|#mixC (ocean-model mixture, q = 1/3, C2 silent, ruling-C mixture) re-weighted by exp(Delta) carried to the 0.1 deg map by IDW (6 nearest pilot nodes); the GLORYS12 Delta is applied to both ocean models. Run I NOT CONVERGED; EoF physics PROVISIONAL.
