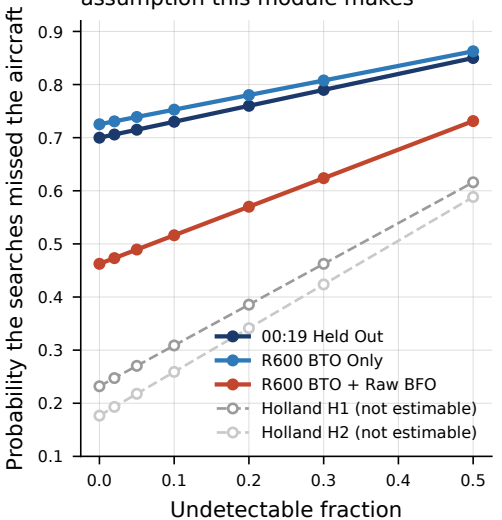
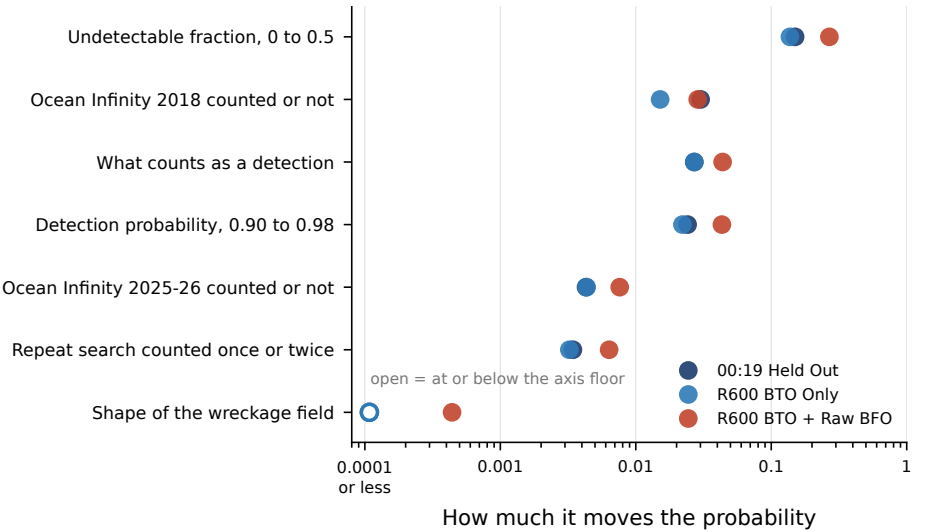
What the searched-area result depends on, in order, on core run C

The undetectable fraction is the largest single assumption this module makes



Ordered against each other, the rest are small (estimable options only)



WHAT THIS SHOWS. Left: the probability that the searches missed the aircraft, against the fraction of the sea floor where the wreck could not have been found even though the sonar looked there - hidden by terrain, buried, or seen and dismissed. There is no published value for it, so it is swept from 0 to one half. Right: every assumption this module makes, placed on the same scale. The sweep is the big one. Whether the 2018 Ocean Infinity search counts, and what the sonars had to see to call it a find, come next. The shape of the wreckage field on the sea floor is the smallest thing on the page.

TECHNICAL. Source: end of flight core run C, 4 strata x 8 seeds, 102,400,064 impacts, stratum weights 0.589 free / 0.252 Davey dynamics + radar / 0.135 descent-climb / 0.024 routes (core's own run C table, ~00:12 UTC 11 Oct), constraint +alive. One mh370 evaluate pass per seed over all eight coverage layers; every scenario is then exact algebra on the raw coverage columns, checked against evaluate's own no_find_probability on each of the 32 seeds (max |delta| < 1e-12). Likelihood P(no find | y) = rho + (1 - rho) prod_k [1 - c_k(y) g_k q_k], point target g_k = 1, shared miss dependence, raster 0.01 deg bilinear. ATSB Phase 2 union 120,486.5 km2 at q 0.945; Bluefin-21/Artemis 771.4 km2 at q 0.900 (it removes 0.0000 at every rho); Ocean Infinity 2018 126,009.3 km2 at coverage 0.889 and 0.952, and 2025-26 outboard band 9,696.9 km2 at 0.7808, both COMMUNITY TRACINGS, grade C, inferred from published imagery and vessel tracks, NOT official geometry (coverage/PROVENANCE.md). Detection-definition and field rows from the wreckage-field check on ocean settling's run C samples. LABELS core run C NOT CONVERGED (free split-half 0.918 against floor 0.924); end of flight physics PROVISIONAL, no structural limit (G13), rapid descents above 6,500 ft/min and unloading not reachable; settling breakup table PROVISIONAL; Holland H1 and H2 NOT ESTIMABLE (effective sample size 130 and 242) and are drawn dashed and open, and are left out of the right panel.
