

a

At smoke scale the 00:19 pdfs of the five variants are not separable from seed noise

Correcting the flow doubles the one-engine time and raises its weight at 00:11

b**c**

C-7 option smokes, 10 Oct 2026, Mac arm64, working tree after 8fd2084, config/smoke.toml: 2 seeds x 100,000 particles. Stack davey2016-inmarsat (prior 18:01:49 at 5.6248N 99.0482E, track 289.7 +/- 1.0 deg) + no-exhaustion-prior + fuel fixes s1-s6 (internal-v1, two tanks); (a) adds s7 one-engine flight (constant drift-down U(300, 1000) ft/min) or s8 hold-then-taper (altitude held while KCAS decays at U(7, 11) kt/min to U(207, 227) KCAS, then V/20.7 x (1 - 1.038 (delta/delta_c)^0.864)). 'Flow corrected' = inop_flow_scale 0.5, undoing the 2x in internal-v1 grid_inop. Weight on one engine at 00:11 = weight whose first flame-out precedes 00:11 (both dry before 00:11 is rejected). Seed medians differ by ~1.6 deg at this scale. PROVISIONAL-OVERNIGHT.
