

a Fuel constraints move the 00:19 pdf about 2° north of the Davey reproduction; most of it arrives with the first step

b Steps S1-S7 are cumulative from S0; the two seeds differ by up to 0.6°

Smoke ladder, 10 Oct 2026, deskstar x86_64 (binaries e795c84; S6 632af0b; S7 e65b0e7), 2 seeds x 500,000 particles (100,000 per autopilot mode), config/sensitivity/ladder/scale.toml. Base davey2016 (prior 18:01:49 at 5.6248N 99.0482E, track 289.7 +/- 1.0 deg); S0 adds the fuel tables with the no-exhaustion prior and the fixed (request-17) sampler; s1-s7 are then added cumulatively in the order listed; S5i onwards use the Inmarsat satellite states (davey2016-inmarsat). R3c: the same fuel stack without the no-exhaustion prior. Fuel model internal-v1 from S3; one-engine flow from grid_inop as delivered (2x its tables). Medians are the runner's pooled values (summary.json). SMOKE scale: not converged; differences of 0.1-0.2 deg are within seed noise. PROVISIONAL-OVERNIGHT.
