

Source posterior: core reference-snapshots (prior track 295.66 deg, 8 seeds x 7M particles; fails split-half), per-particle positions at 00:19:37 UTC, convolved with the PROVISIONAL eof-2f descent kernel (0.934 within 15 NM; 0.032 NW quadrant 30-50 NM; 0.034 NW quadrant 50-103.4 NM). No 00:19 burst scoring of impacts and no seabed-search evidence. Label: 295.66 deg prior; superseded on re-run.

Under H: ocean models GLORYS12 + ERA5 and GlobCurrent daily + ERA5 at equal weight; measured transport error (GDP-replay OU fit per component, no added diffusivity); windage 0-5 % uniform; released 00:20 UTC 8 Mar. Pleiades rating-5 objects in 6 clusters at 3 km, equal cluster weights ($\rho_4 = 0$). The conditional is $p(\text{impact} \mid \text{Pleiades}, H)$; no Bayes factor or $P(H \mid \text{data})$ is computed or implied.

Panel d: Handley & Lemos (2019) tension probability, pooled (dot) and 8-seed range (bar); 'declared' = superseded σ_e 0.05 m/s, T_e 2 d, K 30-1000 m²/s. Orange line: 7th arc (prior-work grid); circles: Pleiades clusters; solid blue: 90 % HDR; dashed grey: unconditional 90 % HDR.
