

Conditional antenna-gain sensitivity of the impact posterior

Paired source sensitivity

EOF scenario hash is identical.
Weighted-mean separation: 0.3 NM
90% HPD area change: +6.2%
Median impact-time change: -0.1 min

Only the 00:11 source posterior differs.
The antenna-gain result is conditional and is not pooled with the baseline or treated as evidence for terminal-model selection.

R600 BTO remains the sole added EOF likelihood in both panels.
