

MH371 known-flight WSPR arc-time windows

PHaRLAP-filtered raw clusters before control subtraction: common-aircraft-altitude propagation screen

Blind, epoch-partitioned selection; 25 km clustering,  $\geq 3$  independent links. These are all PHaRLAP-screened clusters in the central arc-time window before the  $\pm 60$ -minute controls are subtracted. Distance is to the static aircraft position at the BTO epoch and is descriptive, not a time-aligned recovery score for clusters from other WSPR slots. Truth and the joined report track were added only after selection. Latitude limits are symmetric about truth; pale-grey bands are outside the frozen candidate-search latitude. The ruler is a north/south great-circle distance.
