

Two-station correlation geometry compared with the independent integrated PDF

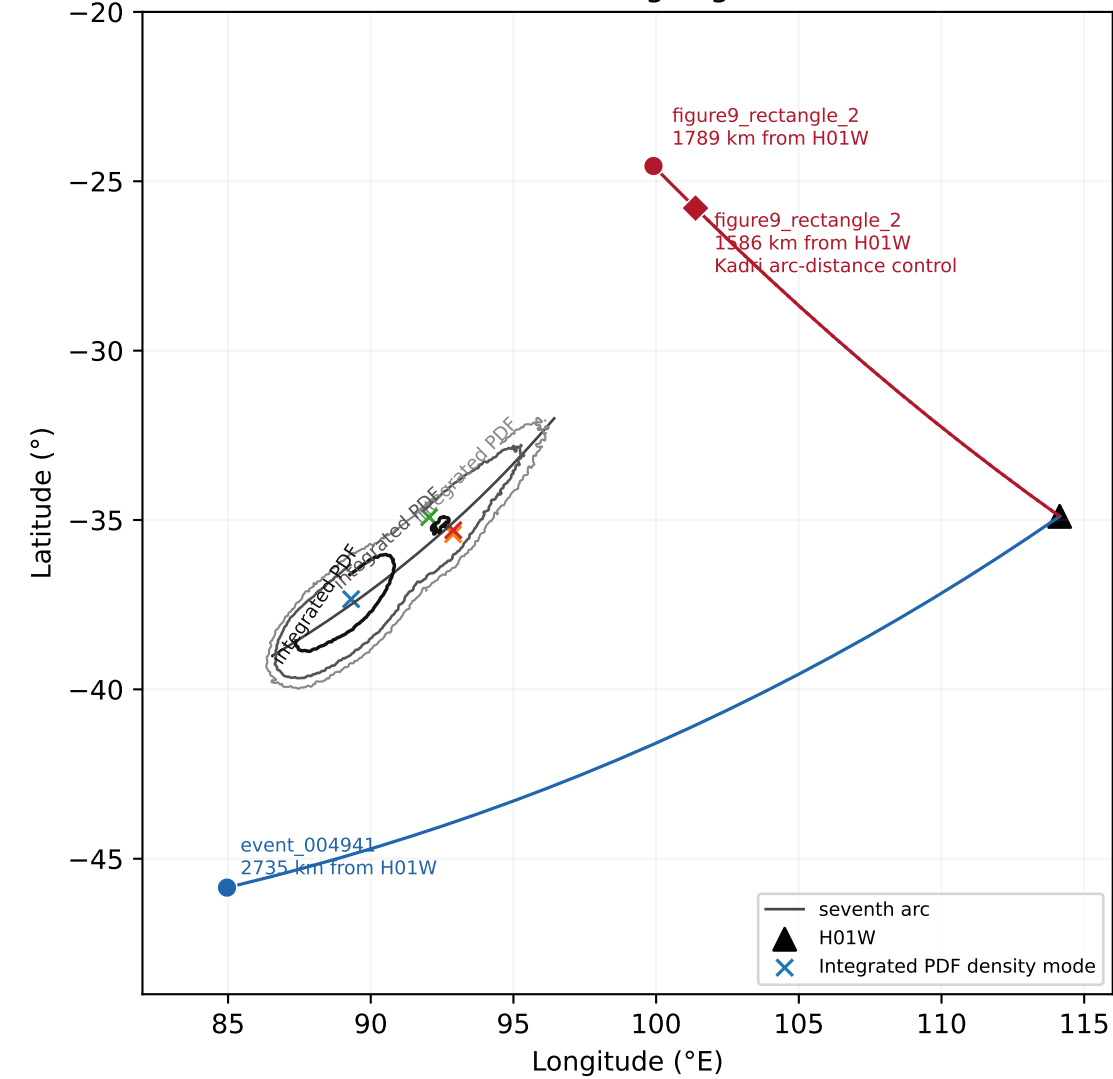

A. Primary rank-8 correlation (airgun-contaminated)

B. Rank-20 with ± 3 s score exclusion

C. Conditional bearing-lag intersections

A source cell changes only the H08S–H01W travel-time difference. Stripes are range-difference contours. Panel C assumes the correlation lag and the labelled H01W signal are the same event; the points are conditional intersections, not detections.
