

Unfiltered publication-trace acquisition scan over the Pléiades-conditioned source grid

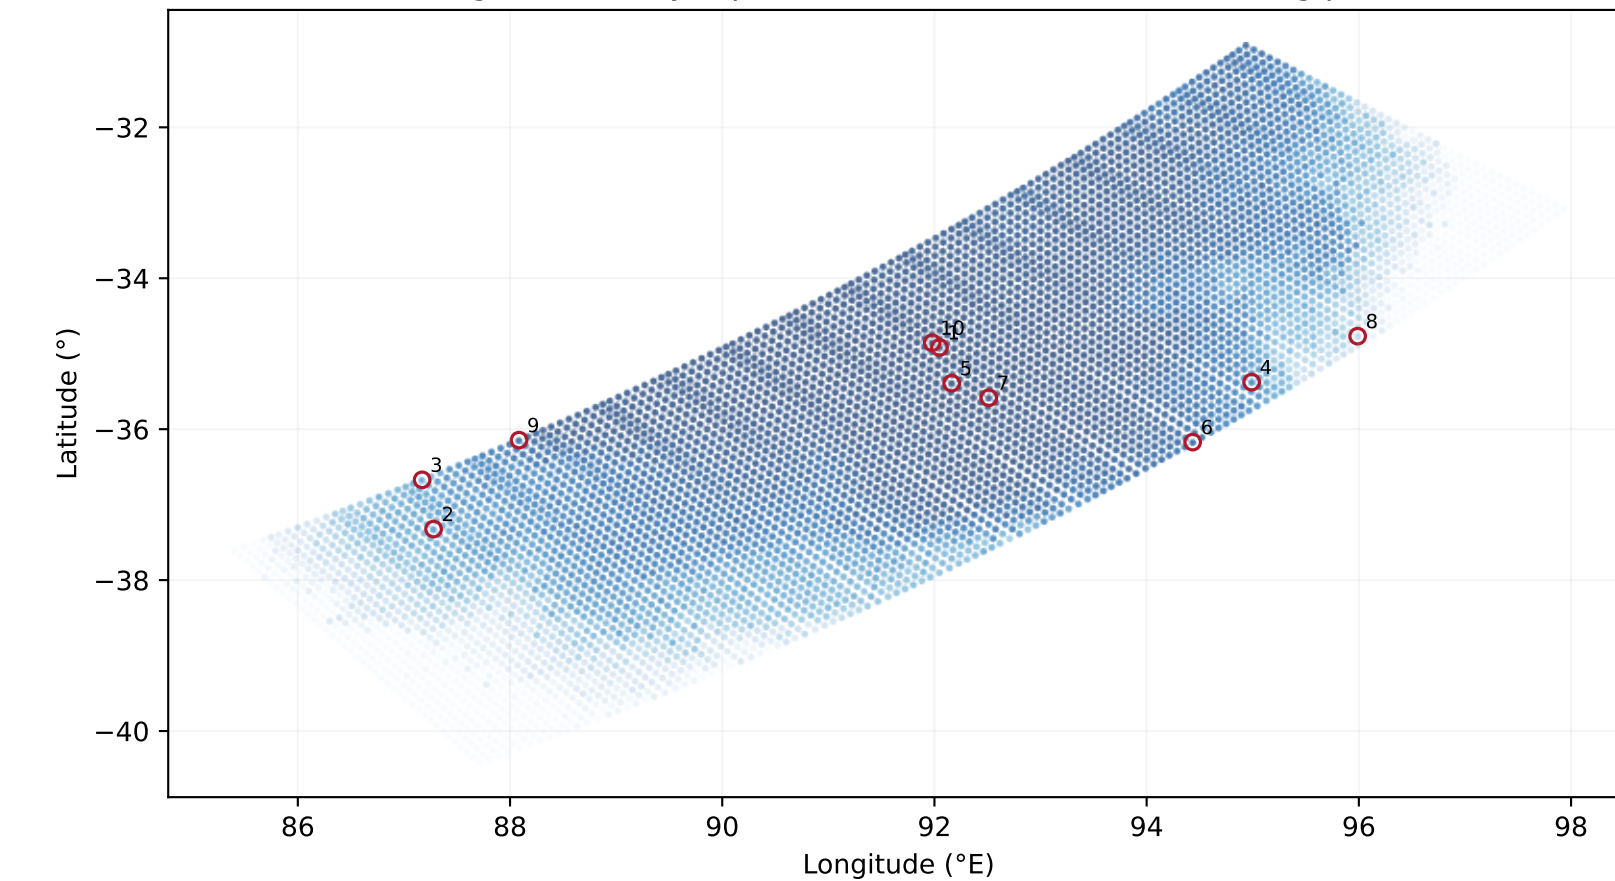

A. Acquisition response over geometry plus ± 5 s fine lag

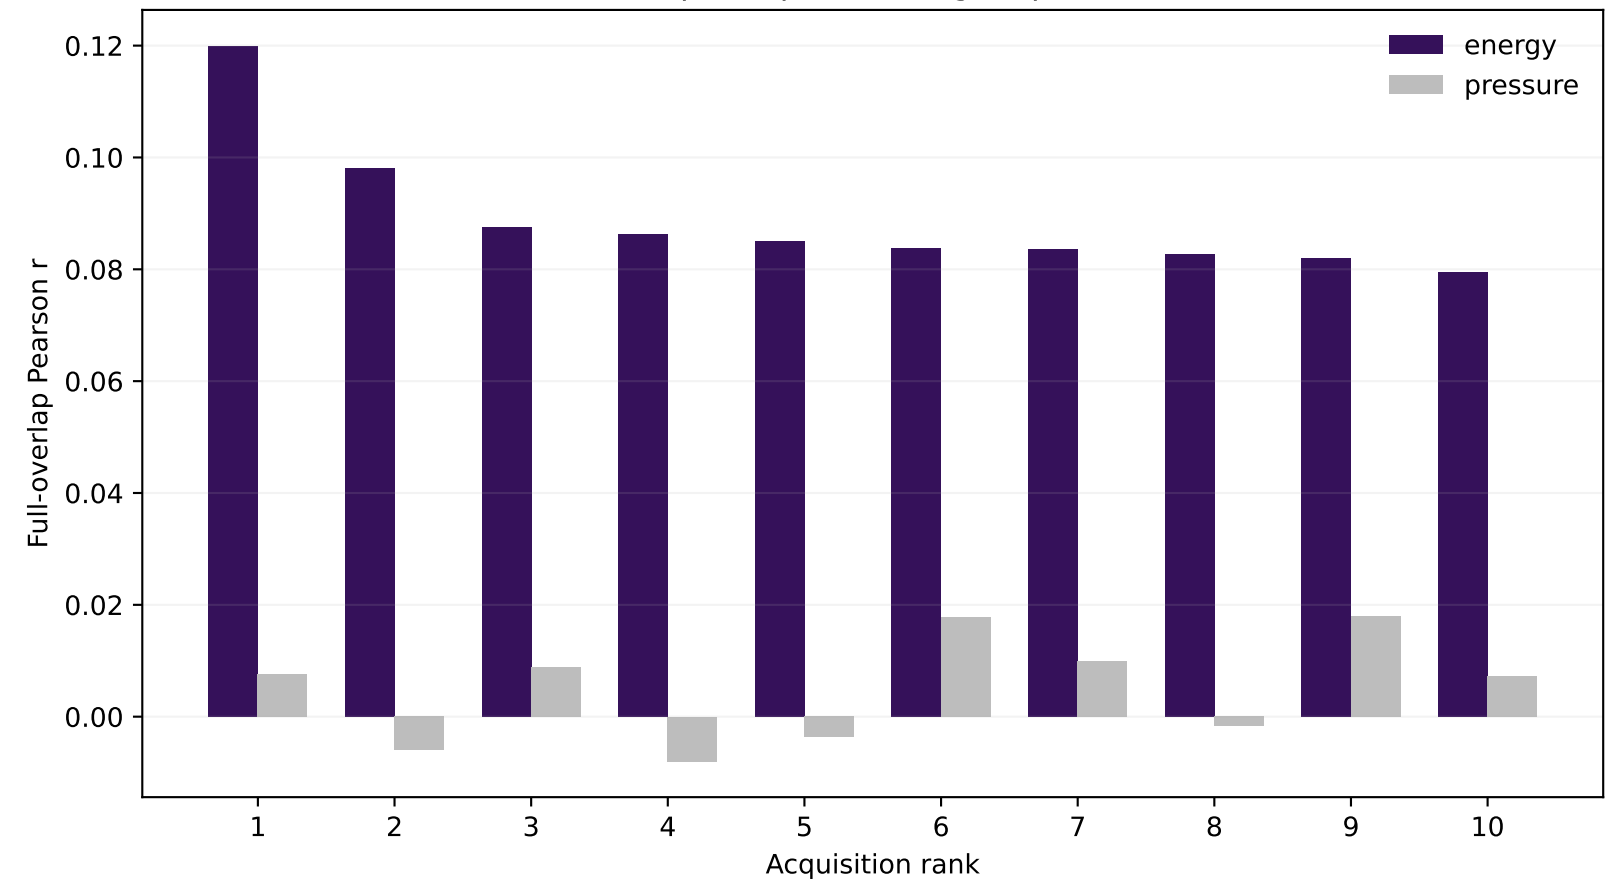

B. Overall lag noise and trials-aware surrogate maxima

C. Highest-density representative source cell for each lag peak

D. Top independent lag responses

A source cell supplies only a range-difference lag; the plotted cells are highest-density representatives of non-unique contours. Candidates are ranked by energy correlation, not by pressure or the illustrative pulse template.
