

Early-MH370 received-power control: calibration then forward holdout

Closest valid alternative to a spatial posterior; this figure does not estimate position.

Chronology

16:42 6 channel-event points set one flight-wide offset for each endpoint

16:55 and 17:07

12 later channel-event points are forward holdouts. Known position and ground track are used only for received-power prediction, not localization.

Two bursts are the replicate units; repeated raw reports are aggregated. Ground track substitutes for true heading.
