

Pléiades-conditioned forward-transport source compatibility
BRAN2016, OSCAR v2 Final, and GLORYS12-WAVERYS alternatives with a declared equal-prior mixture; conditional on an equal-weight rating-5 object-location mixture

Shading and contours are normalized two-dimensional source-cell density; no transverse display width was added. The three transport families differ materially (pairwise total variation 0.484–0.570; mode separation 53.8–94.4 km). The final panel is their declared equal-prior mixture; the families are never multiplied as independent evidence and their spread is not treated as sampling error. This is transport compatibility, not an object-attribution result or a calibrated crash posterior.
