

MH370 7,500 km² search-planning sensitivity

Impact-particle input: runs/mh370/release-v0.1/conditional/pleiades-bran2016/conditional-spatial-particles.csv · 2560 weighted particles · deterministic 35 km Gaussian KDE · numerically unresolved non operational

12 × 625 km² = 7,500 km² · posterior-only mass 60.431% · proxy-sensitivity mass 60.431% · 12/12 selected tiles overlap

Panel B applies declared soft opportunity multipliers and a greedy transit sequence. These are scenario assumptions—not probability of detection, negative-search evidence, or posterior weights.

Exact OI AUV swaths, complete quality/holiday masks and calibrated PoD remain unavailable; official and reconstructed context layers retain distinct symbology.
