

MH370 00:11 → impact: unweighted conditional mechanics sensitivity

PRELIMINARY DIAGNOSTIC – generic attached-flow point mass; not B777 calibrated; no scenario probabilities

Branches with zero R600 support

- 172 kg residual fuel: low, medium, high flow
- 860 kg residual fuel: high flow

Interpretation boundary

Zero support applies only to this declared zero-lift post-flameout point-mass family. It is not a general fuel-scenario rejection.

Left/right 60 s and 120 s feed-order twins are exactly coincident under symmetric inputs.

R600 BTO $18,400 \pm 63 \mu\text{s}$ is the only new likelihood. R1200 BTO and both raw BFOs are held out/diagnostic. Static dry-ISA-like density, zero wind, APU disabled, zero lift after dual flameout. 512 systematic source draws, seed 370023. HPD contours use the fixed 5-cell display kernel.
