

Each row is one H085 airgun-like shot (110 shots, 9.95 s cadence; weak secondary pulses excluded), from Kadri (2024) Fig. 9 vectors (01:00–01:20 UTC 8 Mar 2014; filtered 2–40 Hz, single channel, vertex-simplified). Rows show the 0.25 s energy envelope, aligned by cross-correlation (± 0.5 s). (a) envelope relative to each shot's peak (median of the ± 6 neighbouring shots, levelled on the peak window, so the residual is zero there by construction); dotted lines mark the pre (–3 to –1 s), peak, post (1–4 s) and tail windows. (c) shape correlation with the local template, median 0.79; red square / green line = the single PCA outlier (01:01:33.8, H01W coincidences at chance). No shape or shoulder residual exceeds 3 robust σ . Injection: 50 % detection at –3 dB relative to a median shot. Pre-registered h085_shot_template.py (360bf14). No impact-PDF input in this figure.
