(i) Each row is one possible signal at one recorder. The rank uses an approximate likelihood ratio: how likely the signal is if it comes from the aircraft, compared with how often noise gives such a signal. ln LR below 0 means noise explains it better; all 184 signals have ln LR below 0. The two shaded rows are the Cape Leeuwin signals at Kadri's two times (text time 00:52:03, caption time 00:54:30). The coupling is the share of impact energy that must become sound; above 1 is not possible. Estimates only, no detection.

(ii) EXPLORATORY ranking, pre-registered at module commit 9f47cf7; not part of the frozen searches. Source posterior run J geometry sample, 00:19 Held Out (D0'), p = 0.5. ln LR = ln f_time + ln f_amp|time - ln(p/55 s): f_time = sum_i w_i K_t (Gaussian timing kernel, block 11); f_amp|time = mean over eta log-uniform [1e-6, 1e-2] of P_D(snr; alpha = p) x level consistency (sigma 10 dB) x Kadri Table 1 bearing term (within 30 s; t3, 3.3 deg) given the time match. Coupling = level match at the reference impact (37.1 S on the arc, 1.13 GJ, tau90 3.3 s): IMOS from the 5-40 Hz excess with the corrected RAM-grid TL (the searches' column used pass-A TL, about 20 dB more loss, so its IMOS values are about 100x higher; G-S5); panels from the searches' eta_needed. Reference F-35A eta 2.1e-4 (provisional - from Brown 2026's quote of Metz 2023; re-derivation from Metz pending). Scott Reef 3250: blocked path, ln LR -inf. H08S raw-panel rows are airgun-dominated (G-S9); 3315 and 3275 use the paired logger's null (G-S4); 2-5 Hz IMOS rows are below the 8 Hz hardware corner. Without the bearing term the 00:52:04 row has ln LR -2.75 (would rank 4) and the 00:54:29 row -3.40 (would rank 13); the bearing term also moves their most likely source to about 28 S 99-100 E. Full table ranked_singles.csv. PREDICTIVE, NOT CALIBRATED; C1, C2.
