Ten best 0.5° blocks after all searches: most lie on ground already searched

Pipeline test, before calibration, not for release. Source: composer views v3.2 on run J, all evidence (core + drift finds + searched areas), per-cell detection model V1 central, Ocean Infinity 2018 and 2025–26 included (grade C), settled seabed. Blocks are 2 × 2 equal-area cells (about 3,100 km²), ranked by posterior mass; numbers give rank. Block colour: existing coverage below 0.1 (unsearched), 0.1–0.5 (partly), at least 0.5 (searched). Grey: highest-posterior-density regions. Technical: Davey eq. 11.2 ranks by mass × P_D with P_D constant, so rank = mass rank; coverage = 1 − Π(1 − c_i) over Phase 2 (per cell), Ocean Infinity 2018 (0.889) and 2025–26 (0.7808); planned block = community tracing of the inboard band.
