Simulated descents (end-of-flight chart): not redrawn on run J

No run J descent time series exist. The run J products under mh370-exchange/end-of-flight/run-j/ hold one row per impact (impacts32.npy with COLUMNS.txt, tau90_v1.npz, attitude_v1.npz, parents32.npy, terminal.json): impact state, take-over altitude, flame-out time, altitude and vertical speed at 00:19:29 and 00:19:37, maximum descent rate and time descending, but no altitude-against-time traces. No script for the original chart was found in results/ on the work branch. Redrawing the chart from these summary columns would be a reconstruction, not the simulated trajectories, so it was not done. The original chart (21 Oct) stays as it is; it is from an earlier ensemble, not run J.

Gap: run J descent traces were not saved by the end-of-flight module (request: save altitude-time traces for selected examples).
